Copyright © 2015 Ghana Statistical Service

PREFACE AND ACKNOWLEDGEMENT

The Ghana Statistical Service wishes to acknowledge the contribution of the Government of Ghana, the UK Department for International Development (UK-DFID) and the World Bank through the provision of both technical and financial support towards the successful implementation of the Poverty Mapping Project using the Small Area Estimation Method.

The Service also acknowledges the invaluable contributions of Dhiraj Sharma, Vasco Molini and Nobuo Yoshida (all consultants from the World Bank), Baah Wadieh, Anthony Amuzu, Sylvester Gyamfi, Abena Osei-Akoto, Jacqueline Anum, Samilia Mintah, Yaw Misefa, Appiah Kusi-Boateng, Anthony Krakah, Rosalind Quartey, Francis Bright Mensah, Omar Seidu, Ernest Enyan, Augusta Okantey and Hanna Frempong Konadu, all of the Statistical Service who worked tirelessly with the consultants to produce this report under the overall guidance and supervision of Dr. Philomena Nyarko, the Government Statistician.

Dr. Philomena Nyarko
Government Statistician

EXECUTIVE SUMMARY

Introduction

This is the second poverty map report to be produced by the Ghana Statistical Service. The first was produced in May 2005 using data from the 2000 Population and Housing Census and 1998/1999 Ghana Living Standards Survey. The poverty indicators in the current report have been computed based on data from the 2010 Population and Housing Census (2010 PHC) and the 2012/2013 Ghana Living Standards Survey (GLSS6). The methodology for the computations, which was developed by C. Elbers, J. Lanjouw and P. Lanjouw (2000), allows accurate estimates of consumption-based poverty and inequality at lower levels of disaggregation by combining information from censuses and household consumption surveys.

The report presents the poverty headcount, depth and inequality for all the 216 districts and 29 sub-districts in the country.

National

Mapping the incidence of poverty in the country shows that there is a high concentration of poverty in the North Western part of Ghana. Though incidence in the districts of the South Western parts is very low, there are however few districts with relatively high incidence.

The concentration of poor persons is mainly observed in the northern than the southern districts of Ghana. Among the districts in Ghana, East Gonja in the Northern Region stands out as the district with most of the poor persons. Districts in the Southern Ghana on the other hand show very low concentration of poor persons, there are few districts with high number of poor persons, but these numbers cannot be compared to what pertains to districts in the northern part of Ghana.

Aside poverty incidence rate and number of poor persons, high depth of poverty is marked in districts in the northern half of the country as well. Across the country, inequality exists but follows no pattern. The poverty mapping exercise has revealed a striking pattern that would not have been apparent.

Western Region

Wassa Amenfi Central (51.9%) has the highest poverty headcount in the Western region followed by Bodi (42.5%) and Mpohor (40.4%) districts. The three districts also have high poverty depth (17.1% for Wassa Amenfi Central, 13.7% for Bodi and 12.1% for Mpohor) compared to the other districts. Suaman (6.0%), Wassa Amenfi West (6.9%) and Aowin (8.9%) districts have the lowest poverty headcounts in the region.

Central Region

Poverty incidence in the Central Region is highest in the Ekumfi District (48.4%) followed by Awutu Senya District (33.6%) and Upper Denkyira East Municipal (30.6%). Cape Coast Metropolis (2.6%), Upper Denkyira West District (3.3%) and Agona West Municipal (4.4%) have the lowest incidence of poverty in the region. Inequality is high in Awutu Senya East

Municipal (42.6), Upper Denkyira East Municipal (41.8), Assin North Municipal (41.8) and Awutu Senya District (41.5).

Greater Accra Region

La Dade Kotopon Municipal (1.3%), Accra Metropolis (2.5%) and La Nkwantanang Madina District (2.8%) have the lowest poverty incidence in the region. The highest incidence of poverty is observed in Shai Osudoku District (55.1%), followed by Ningo Prampram District (31.2%). The two districts also have higher poverty depth (23.2% for Shai Osudoku and 10.1% for Ningo Prampram) compared to the other districts.

Volta Region

Poverty incidence in the Volta region is highest in the Adaklu District (89.7%) followed by Kadjebi (66.8%) and Agotime Ziope (62.1%) districts. The depth of poverty for Adaklu (46.9%) and Agotime Ziope (30.1%) are high compared to the other districts. Akatsi South (10.5%) has the lowest incidence of poverty. Inequality is highest in North Tongu District (46.0) followed by Nkwanta South (45.2), Biakoye (45.0) districts and Kpando Municipal (44.4).

Eastern Region

Kwahu Afram Plains South District (59.7%) has the highest poverty incidence in the Eastern Region followed by Kwahu South (48.0%) and Upper Manya (43.6%) districts. High poverty depth is also observed in the three districts (21.2% for Kwahu Afram Plains South, 16.3% for Kwahu South and 11.2% for Upper Manya). Four districts, New Juaben Municipal (4.6%), Denkyembour (4.6%), Nsawam Adoagyiri Municipal (6.3%) and Suhum Municipal (6.5%) have low incidence of poverty. Inequality, on the other hand, is relatively low in Upper Manya (27.2), Lower Manya (28.3) and Ayensuano (29.3) compared to the other districts in the region.

Ashanti Region

Poverty incidence in the Ashanti region is highest in the Sekyere Afram Plains North (59.6%) followed by Ejura Sekye Dumasi (47.0%) and Ahafo Ano North (46.4%) districts but very low in Asokore Mampong Municipal (3.3%), Afigya Kwabre (4.0%) and Atwima Kwanwoma (4.9%) districts. Poverty depth is high in Sekyere Afram Plains North (24.3%), Ejura Sekye Dumasi (17.0%) and Ahafo Ano North (16.4%) districts. Sekyere Afram Plains North (49.8) is the only district in the region with inequality higher than the regional average of 37.3.

Brong Ahafo Region

Kintampo South District (78.3%) has the highest poverty incidence in the Brong Ahafo region followed by Banda District (78.0%). The lowest incidence of poverty is observed in Dormaa West District (9.9%). Poverty depth is relatively high in Banda (37.9%) and Kintampo South (35.8%) compared to the other districts in the region. Inequality is highest in Sunyani Municipal (64.0) followed by Asutifi South (53.4), Wenchi Municipal (51.7) and Jaman North District (51.1).

Northern Region

The Northern region has the third highest poverty headcount in Ghana. The incidence of poverty is highest in East Gonja (84.2%), followed by Bole (79.4%) and Kpandai (76.9%) districts. The lowest poverty incidence of 24.6 percent is observed in Tamale Metropolis. Compared to the regional value (15.5%), the poverty depth is high in the East Gonja (40.9%), and Bole (38.1 %) districts.

Upper East Region

The incidence of poverty is quite high among districts in the Upper East Region, with the highest incidence observed in Builsa South District (84.4%) followed by Bawku West (68.1%), Bongo (67.4%) and Nabdam (63.0%). Kassena Nankana West District (13.1%) has the lowest poverty incidence in the region. Poverty depth is highest in Builsa South (51.8%).

Upper West Region

Poverty incidence is highest in Wa West (92.4%) followed by Wa East (83.8%) and Sissala West (81.2%) districts. Poverty depth is relatively high in Wa West (59.0%).

Conclusion

In an effort to reduce poverty in Ghana, households in the most affected districts in the Volta, Brong Ahafo, Northern, Upper West and Upper East regions must be targeted for social intervention programs. Special studies also need to be undertaken to clarify the causes of poverty in the country.

CHAPTER ONE

INTRODUCTION

The paucity of data on welfare indicators at the district level has been a challenge in the design, monitoring and evaluation of economic and social programs in Ghana. Although the 2010 Population and Housing Census (2010 PHC) conducted by the Ghana Statistical Service (GSS) provides comprehensive information on the demographic and socio-economic characteristics of households and individuals, it does not have the required information for constructing consumption or income aggregates.

The sixth round of the Ghana Living Standards Survey (GLSS6), conducted during the period October 2012 to October 2013, produced detailed information on consumption expenditure which makes it possible to construct reliable consumption-based welfare measures at the national and regional levels. The GLSS6 was a nationally representative sample survey of 18,000 households, of which 16,772 households were successfully interviewed.

The design of the survey does not allow the estimation of welfare measures at the district and other lower levels of disaggregation. However, a methodology developed by C. Elbers, J. Lanjouw and P. Lanjouw (2002) allows accurate estimates of consumption-based poverty and inequality at lower levels of disaggregation by combining information from censuses and household consumption surveys.

This methodology involves selecting a set of common and comparable variables in the census and the survey. The selected variables are then used to estimate a regression model of per capita consumption based on the survey data. The set of parameter estimates obtained from the consumption model is applied to similar variables in the census to obtain the predicted per capita consumption for each census household, which are then used to prepare poverty maps.

A poverty map is a spatial representation and analysis of welfare indicators. In 2005, the first poverty map was produced by the Ghana Statistical Service from the 1998/1999 Ghana Living Standards Survey and the 2000 Population and Housing Census. This report is the second in the series of poverty maps produced in Ghana.

The main objective of this second poverty mapping report is to produce welfare estimates for the 216 districts and 29 sub-districts in Ghana to inform policies and programmes. The districts and sub-districts are the lowest levels of administration and decision-making under the decentralised local government system in the country.

Welfare estimates for the regions based on the census are also provided to enable comparisons with those obtained directly from the GLSS6. It must be noted that the estimation was done separately for each region using different sets of common variables. Fitting different models for each region allows a flexible relationship between per capita expenditure (the dependent variable) and the selected variables, which leads to better predictions.

The report consists of four chapters. Chapter one covers the introduction; Chapter two describes in detail the methodology and sources of data; Chapter three presents the results of the poverty and inequality estimates for districts and sub-districts and Chapter four provides some conclusions and recommendations.

CHAPTER TWO

METHODOLOGY

This chapter describes in detail the Small Area Estimation (SAE) methodology and sources of data used for poverty mapping at the district and sub-district levels. This method allows the imputation of consumption expenditure for census households based on a model estimated from the household survey by applying the estimated coefficients of the model to the same variables from the census data. In constructing the consumption model, the explanatory variables (household and individual characteristics) must exist in both the census and the survey data. Poverty and inequality statistics for districts and sub-districts are then calculated with the imputed consumption estimates of census households. The method does not only estimate poverty indices but also their corresponding standard errors.

The SAE methodology involves three major steps. The first step is to select a set of variables that are common to a census and a household expenditure survey. The subset of variables that are found to match (contain the same information) between the census and the survey is used to estimate a regression model of per capita consumption using the survey data.

At the second step, the set of parameter estimates obtained from the regression model is applied to the same set of variables identified in the census data to obtain predicted per capita consumption for each census household.

Finally, based on the estimated level of per capita consumption, estimates of poverty, inequality and other welfare measures, as well as their standard errors, are calculated for any geographical unit with sufficient number of households to obtain reliable estimates.

Data sources

Ghana is divided into 10 administrative regions. There are 216¹ districts, five of which are metropolitan. These five metropolitan districts are further divided into 29 sub metropolitan districts. The country is also divided into three ecological zones namely coastal, forest and savannah. Some regions (Western, Brong Ahafo and Volta) cut across two ecological zones.

This report is based on data from the sixth round of the Ghana Living Standards Survey (GLSS6, 2012-2013) and 2010 Population and Housing Census (2010 PHC).

The GLSS6 is an integrated household survey covering topics such as household consumption and expenditure, education, employment, housing conditions, the operation of non-farm household enterprises, agricultural activities, assets and agricultural production expenditures.

As in all probability sample surveys, it is important that each sampling unit in the target population has a known, non-zero probability of being included in the sample. To achieve this, an appropriate list or sampling frame of the Primary Sampling Unit (PSU) is required. The list of standardized census EAs - together with their respective population and household

¹ At the time of the 2010 PHC, there were 170 districts. Later 46 additional districts were created out of the existing districts. The affected districts were re-demarcated and the census data was realigned to reflect the current 216 districts.

sizes - from the 2010 Population and Housing Census (PHC) was used as the sampling frame for the GLSS6.

To enhance the precision and reliability of the survey results, the EAs were first stratified into 10 main domains according to the ten administrative regions in Ghana. Within each region, the EAs were further stratified into rural and urban categories, bringing the total number of substrata to 20. A random sample of 1200 EAs was then selected according to probability proportional to population size to form the PSUs.

A complete listing of households in the selected PSUs was undertaken to form the Secondary Sampling Units (SSUs). Subsequently, 15 households from each PSU were selected systematically, yielding a total sample size of 18,000 households nationwide.

The unit of measurement for the GLSS6 was the population living within individual households. The institutional population (those who were in schools, hospitals, etc.), which represents a very small percentage (2.36%) of the 2010 population, was excluded from the frame because they do not form households.

Weights were computed to reflect the different probabilities of selection in order to obtain the true contribution of each selected EA in the sample based on the first and second stage probabilities of selection. The survey successfully interviewed 16,772 households (93% response rate) and 71,523 individuals.

The results from the GLSS6 show wide disparities in the level of poverty among regions in the coastal, forest and savannah zones. The dynamics of poverty in Ghana indicate that poverty is still very much a rural phenomenon and more prominent in rural savannah.

The 2010 PHC collected information on demographic, social, economic and housing characteristics of the population. The census enumerated 24,658,823 individuals and 5,467,136 households. However, 24,075,944 individuals in 5,467,054 households in occupied dwelling units were included in the analysis.

Common and comparable variables

Questions from the 2010 PHC and GLSS6 instruments were compared to obtain “candidate” variables. These variables are those for which the questions were worded the same way in the survey and the census, including the response options (See Appendix Table A3.1).

Correlates of household welfare (dependency ratio, household size, age of head, proportion of males in household, highest level of schooling completed, labor market status of head, etc.) were constructed from the matched variables from both data sources. The data from the survey was weighted to be nationally representative before the means of the correlates were compared. Only those variables whose census mean fell within the 95 percent confidence interval of the survey mean were included in the regression model. Since the survey and census years did not coincide, the means of some correlates were not statistically equivalent. Mapping methodology was applied based on the assumption that the estimated relationship between household welfare and the correlates do not change over time. This assumption is reasonable given that the census and the survey were conducted within 2-3 years interval.

Some variables were aggregated to the cluster, district and regional levels to reduce intra-cluster correlation by capturing variations in household welfare as a result of common cluster level characteristics and location effects. Adding area means helped to explain location effects and has been shown to improve estimates markedly (Elbers et al., 2002).

Modelling and Projection

The model and analysis in this report are done separately for each of the ten regions to appreciate the effect of spatial correlation between consumption expenditure and the selected variables within each region. As discussed in the methodology, the second step of SAE is fitting a relationship between the expenditure and the selected variables. Initially, one model was estimated for the entire country. Although the national level prediction was quite accurate, the regional predictions were poor due to disparities in consumption pattern and the inability of the national model to capture the heterogeneous relationship between the variables across regions. As a result, separate models were estimated for each region to allow a flexible relationship. The regional models gave accurate regional level results and led to the reduction of standard errors associated with the poverty estimates as discussed in chapter three. Only those variables that were statistically significant at the 5 percent level were used for prediction.

Ghana's decentralised administrative system

Ghana is practicing a decentralised system of administration under the local government system as contained in the 1992 constitution (Local Government Act 1993). This makes the district assemblies the highest decision making body at the metropolitan, municipal and district levels. The 216 Metropolitan, Municipal and District Assemblies (MMDAs) prepare their annual plans and program of activities to fit into the national development framework; the Ghana Shared Growth and Development Agenda (GSGDA I and II) prepared by the National Development Planning Commission (NDPC). Data and information are needed by the district assemblies to inform the preparation of these plans, including the implementation of programmes towards government efforts at reducing poverty among the vulnerable population. The preparation of a poverty map at the district level would, therefore, be necessary to inform the assemblies in the development of their plans and programmes.

Small area estimation

Household surveys that include reasonable measures of income or consumption can be used to calculate distributional measures. However, at low levels of aggregation, these samples are rarely representative or of sufficient size to yield statistically reliable estimates. At the same time, census (or other large sample) data of sufficient size that allow disaggregation at lower levels either have no information about income or consumption, or measure these variables poorly. The SAE procedure combines these types of data to take advantage of the detail in household sample surveys and the comprehensive coverage of census. This report applies the small area estimation method developed by Elbers, Lanjouw and Lanjouw (ELL; 2002, 2003).

The observed household consumption in the survey is regressed on selected common variables as

$$\ln(y_{ch}) = X_{ch}\beta + \Omega_{ch} \quad (1)$$

where y_{ch} is the per capita consumption expenditure of household h in sample cluster c ,

$\ln(y_{ch})$ is the natural log of per capita consumption expenditure of household h in cluster c ,

X_{ch} is the vector of selected explanatory variables,

β is the vector of regression coefficients, and

Ω_{ch} , is the vector of disturbances of household h in cluster c .

An initial estimate of β in equation (1), obtained from Ordinary Least Squares (OLS) estimation, gives estimated residuals which can be broken down into two components: a cluster specific random effect and an uncorrelated household error term:

$$\hat{\Omega}_{ch} = \hat{\eta}_c + \varepsilon_{ch} \quad (2)$$

Where $\hat{\eta}_c$ is the cluster-specific random effect, calculated by averaging the within-cluster residuals and ε_{ch} is the household-specific error term estimated as the overall residual minus the location component.

The expenditure of a household in the census is predicted as follows:

$$\ln(\hat{y}_{ch}) = X_{ch}^T \hat{\beta} + \hat{\eta}_c + \hat{\varepsilon}_{ch} \quad (3)$$

Where $\hat{\beta}$, $\hat{\eta}_c$ and $\hat{\varepsilon}_{ch}$ are the estimates for β , η_c and ε_{ch} respectively. The point estimates and standard errors of the welfare indicators are calculated by Monte-Carlo simulations. In each simulation, a set of values for $\hat{\beta}$, $\hat{\eta}_c$, and $\hat{\varepsilon}_{ch}$ are drawn from their estimated distributions, and an estimate of consumption expenditure and poverty rates are obtained.

The original ELL method also draws location errors η_c from their estimated unconditional distributions. For those target population for which sampled data happen to be available, this approach does not make optimal use of available information. An approach proposed by Molina and Rao (2010) combines the simulation-based approach with what is referred to as Empirical Best, which uses the observed distribution of location error in the sampled data. With the adjustment that the distribution functions of the errors are estimated non-parametrically, this approach has been implemented in the PovMap software.

For all ten regional models, and in each simulation, $\ln(\hat{y}_{ch})$ is trimmed at the observed minimum and maximum values in the survey. Subsequently, the average point estimate and standard deviation of 100 simulations of equation (3) is calculated. Finally, predicted expenditure and poverty estimates for all households in the census were aggregated to regional and district level estimates. For the calculation of poverty indices, a poverty line of 1,314.00 Ghana Cedis per person per year was used.

CHAPTER THREE

POVERTY AND INEQUALITY ESTIMATES

Poverty analysis in Ghana has over the years been based on national and regional level indicators that are comparable over time. The broad trends that are identified using aggregate information are useful for monitoring and evaluating the overall performance of poverty reduction programmes in the country. However, for many policy and research applications, the information that can be extracted from aggregate indicators is not sufficient, since they do not reveal significant local variations in living conditions within the country. The detailed poverty maps for small administrative areas that are the ultimate output of this report provide information to help address this shortcoming of aggregate poverty analysis. This chapter provides the poverty and inequality maps at the district level for each of the ten administrative regions.

The welfare measures presented are the ones commonly known as the Foster-Greer-Thorbeck (FGT) family of poverty measures. The poverty headcount (P_0) is the proportion of population living below the national poverty line. Depth of poverty (P_1), also known as the poverty gap, is a measure of how far the poor are from the poverty line, and severity of poverty (P_2) is the square of the poverty gap which gives greater attention to the needs of the poorest. It takes account of the distribution of poverty among the poor, giving greater weight to the poorest of the poor. The Gini coefficient, a measure of welfare distribution, is used to measure inequality. Tables presenting the detailed results are found in Appendix 1. The standard errors of these estimates are also provided as a measure of their level of precision.

How reliable are the poverty estimates?

The performance of our models is tested by comparing the poverty prediction with the survey estimates at the regional level. This comparison is feasible because while the census estimates are obtained at all levels, GLSS6 is representative at the regional level. As shown in Table 3.1, predictions of poverty headcount for all the regions fall within 95 percent confidence interval of the survey means. While this is a common criterion to judge the reliability of the models, our predictions attained a higher degree of accuracy as the absolute difference between the survey estimates and census projections are often very small. This robustness check provides a reasonable level of confidence about the district level predictions of headcount rate and other measures.

With the exception of the Northern Region where there is an appreciable difference between the poverty headcount estimated from the GLSS6 and the 2010 PHC (poverty headcount of 50.4% in GLSS6 and 44.2% in the census), regional poverty headcount from the survey and the census are quite close (Table 3.1).

Table 3.1: Poverty head count by region (poverty line = GH¢1,314)

Region	Census			GLSS 6			
	Poverty head count	Standard error	Absolute Difference (Census & GLSS6)	Poverty head count	Standard error	95% confidence interval	
						Lower limit	Upper limit
Western	19.2	0.0040	1.7	20.9	0.0252	15.94	25.82
Central	19.6	0.0072	0.8	18.8	0.0223	14.44	23.19
Greater Accra	6.6	0.0015	1.0	5.6	0.0151	2.65	8.57
Volta	33.3	0.0028	0.5	33.8	0.0343	27.12	40.57

National Poverty Map

Figures 3.1 to 3.4 show the maps of headcount rate, number of poor persons, depth of poverty and inequality for the 216 districts in Ghana. The map shows that the three northern regions still remain the poorest in the country. Where the map adds value is how it reveals the heterogeneity in standard of living across districts within regions, a level of detail that could not be obtained from the GLSS6 data. For instance, Upper West as a whole has a poverty rate of 70.7 percent. However, within the region, there is a wide variation in the headcount rate across districts. It goes from a low of about 36 percent in Wa Municipal to approximately 84 percent in Wa East and more than 90 percent in Wa West. It is noteworthy that the two poorest districts border the least poor district in the region, a pattern that would not have been apparent without a poverty mapping exercise.

The map also reveals the existence of pockets of poverty and islands of prosperity. The poverty rate in Adaklu district (89.7%) in Volta region is more than two and half times the regional average (33.8%). Although Greater Accra has the lowest poverty rate in the country, poverty is concentrated in two districts – Ningo Prampram (31.2%) and Shai Osudoku (55.1%). In the Northern region where the headcount rate is 50.4 percent, two districts have poverty rates of less than 30 percent – Tamale Metropolis (24.6%) and Sagnerigu Municipal (29.3%).

An alternative way to visualize the spatial distribution of poverty is through the number of poor individuals. Remote, rural, isolated areas may have high headcount rate but may have few poor persons due to their small population size. In contrast, poverty rate may be low in urban areas but they may be host to a large number of poor people. Figure 3.2 shows the number of poor persons by district. Kumasi Metropolis is a good example of the contrast between headcount rate and number of those poor. It has one of the lowest headcount rate (5.3%) in the country but ranks second highest in the number of poor persons (88,935).

Depth of poverty measures how much below the poverty line the poor's standard of living is. The lower the depth of poverty, the closer the poor are to the poverty line, and vice versa. It

is easier to achieve poverty reduction in areas with low depth of poverty. As seen in Figure 3.3, depth of poverty is also the highest in areas with high headcount rate. This means poverty in these regions is not only widespread, it is also entrenched.

Finally, Figure 3.4 shows the distribution of the Gini coefficient, a measure of inequality, across districts. It shows that inequality is relatively high in Upper West and Upper East, two of the three poorest regions, compared to Northern region, the third poorest region.

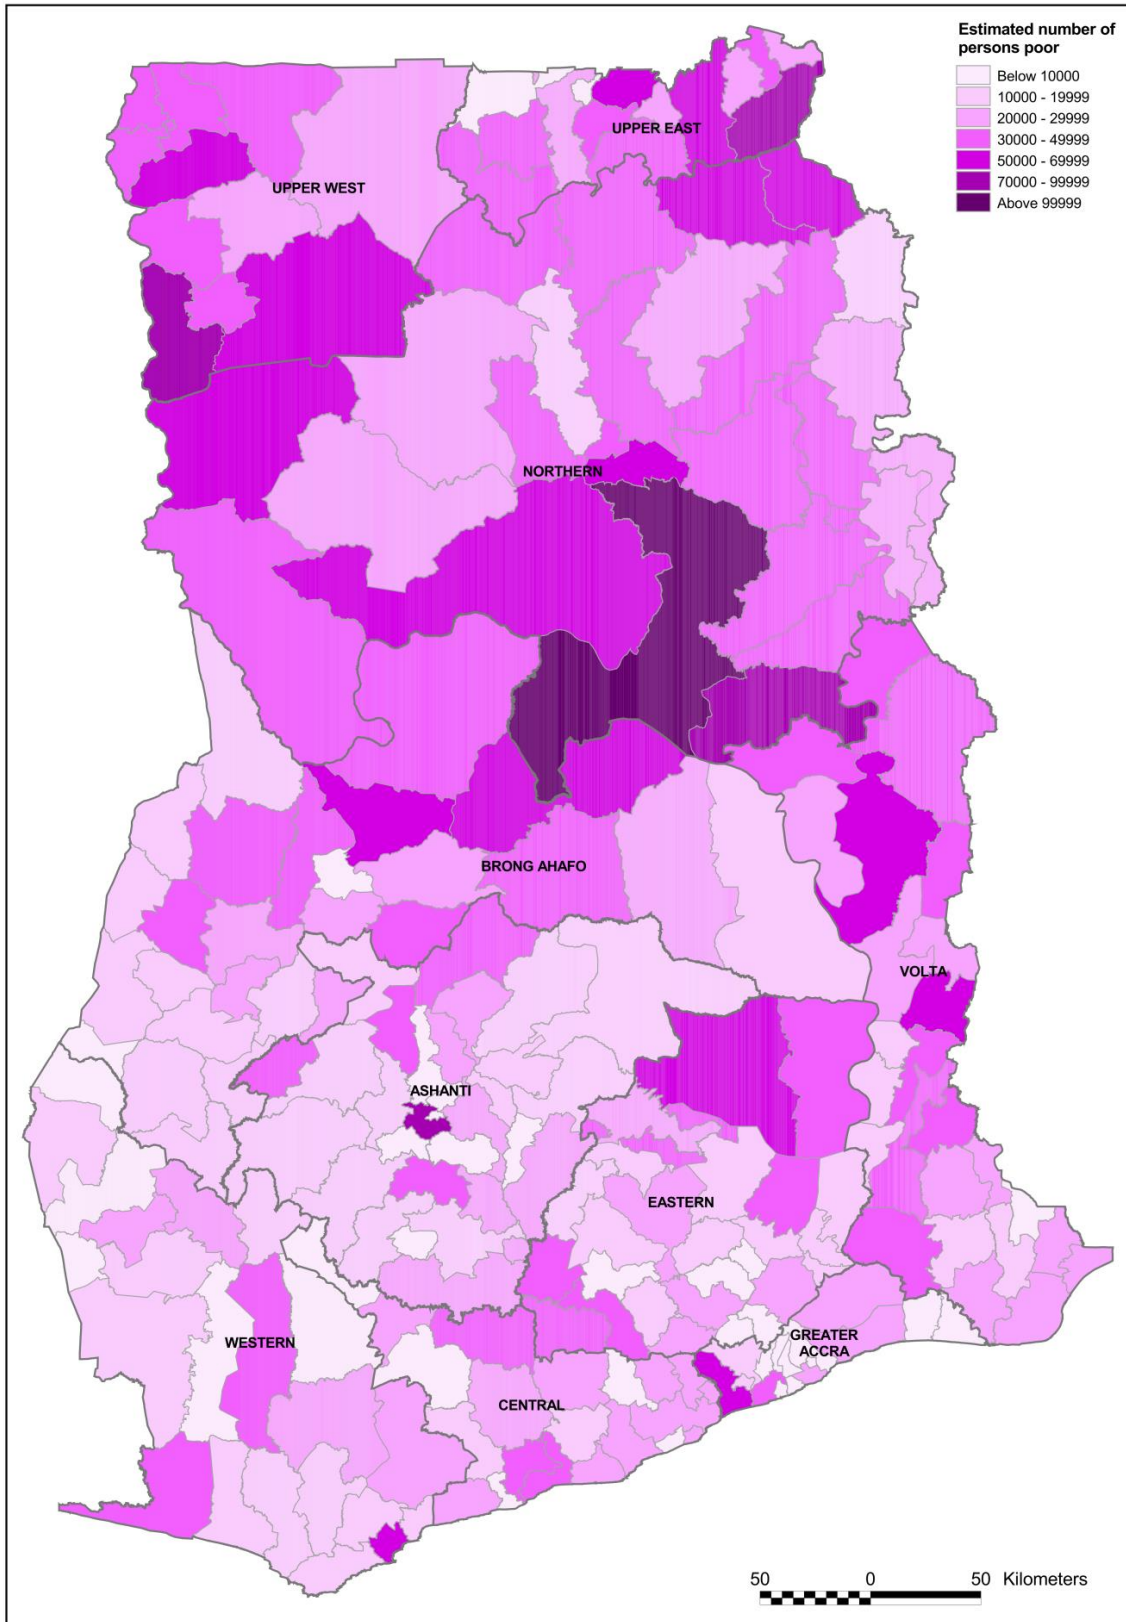

Figure 3.3: Depth of Poverty

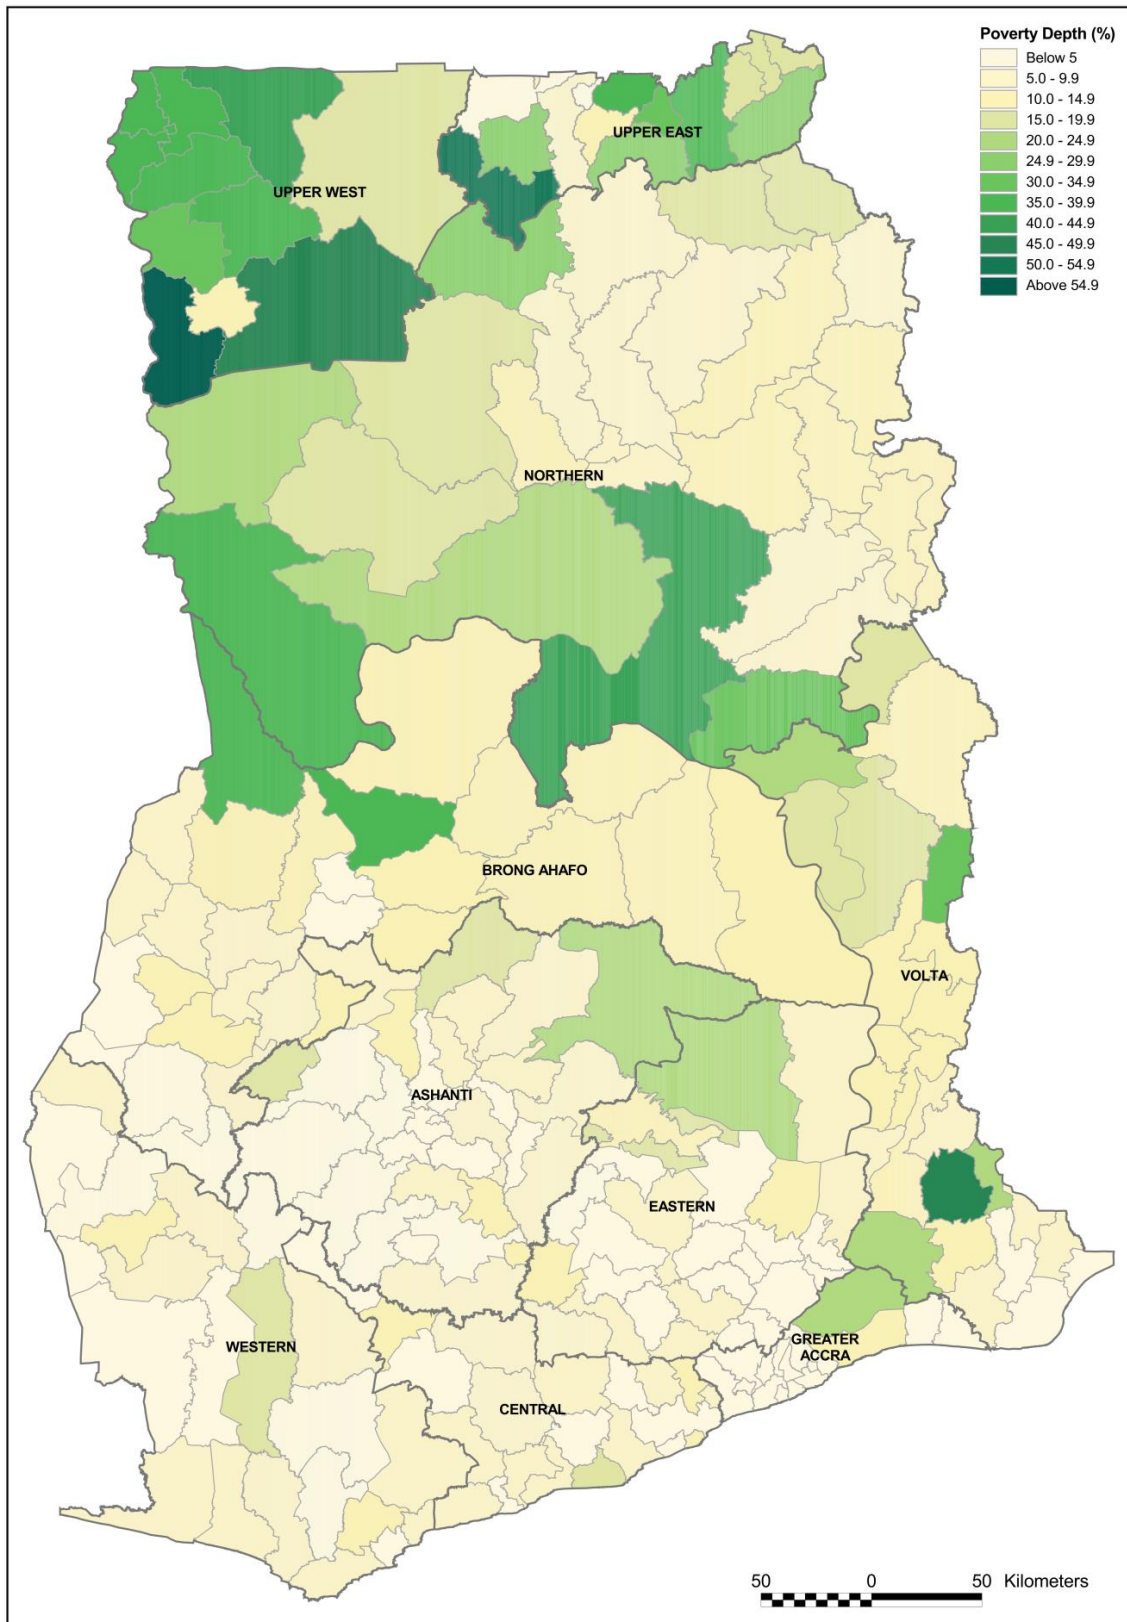

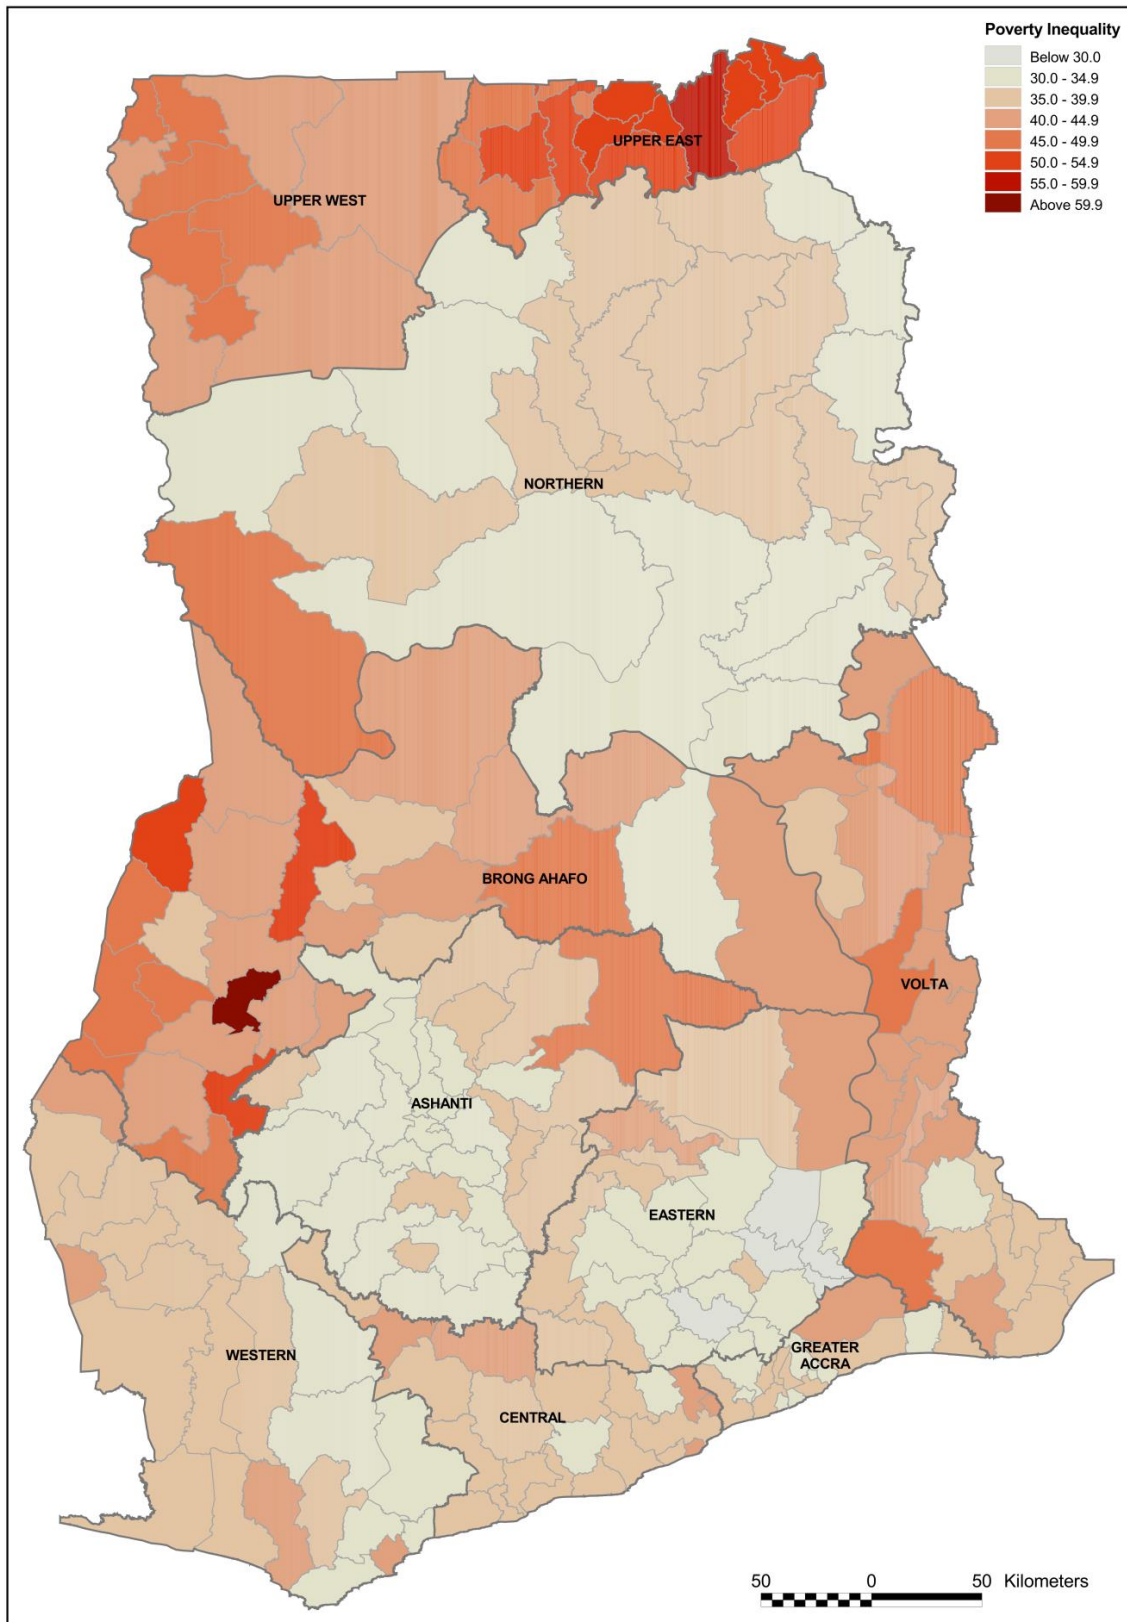

Figure 3.4: Inequality

WESTERN REGION

The spatial distribution of poverty headcount, depth of poverty and inequality for the 22 districts and four sub-districts in the Western Region are presented in Table A1.1 and Figures 3.5 to 3.8. Among the districts in the region, Wassa Amenfi Central (51.9%), Bodi (42.5%) and Mpohor (40.4%) have the highest poverty headcount. The districts with the lowest poverty headcount are Suaman (6.0%), Wassa Amenfi West (6.9%) and Aowin (8.9%). Apart from being the districts with the highest poverty incidence, Wassa Amenfi Central, Bodi and Mpohor districts also recorded the highest depth of poverty and inequality in the region.

At the sub-district level, Sekondi has both the highest incidence of poverty (22.9%) and depth of poverty (7.7%). Essikadu-Ketan has the highest number of poor persons (24,593).

Sekondi Takoradi Metropolis (68,482), Jomoro (44,662) and Wassa Amenfi Central (35,095) are the districts with the highest number of poor persons in the region. Suaman (1,206) and Wassa Amenfi West (6,207) districts have lower number of poor persons (Table A1.1).

Figure 3.5: Poverty Incidence - Western Region

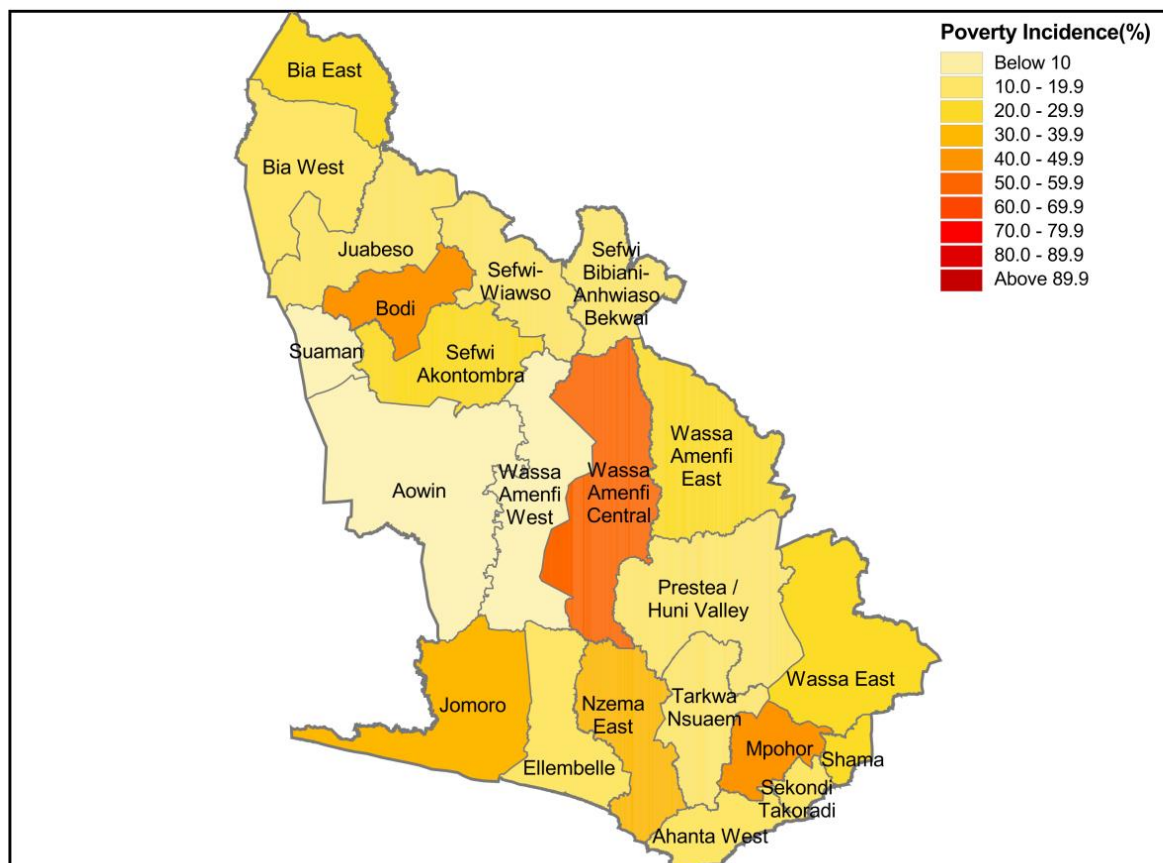

Figure 3.6: Estimated Number of Poor Persons - Western Region

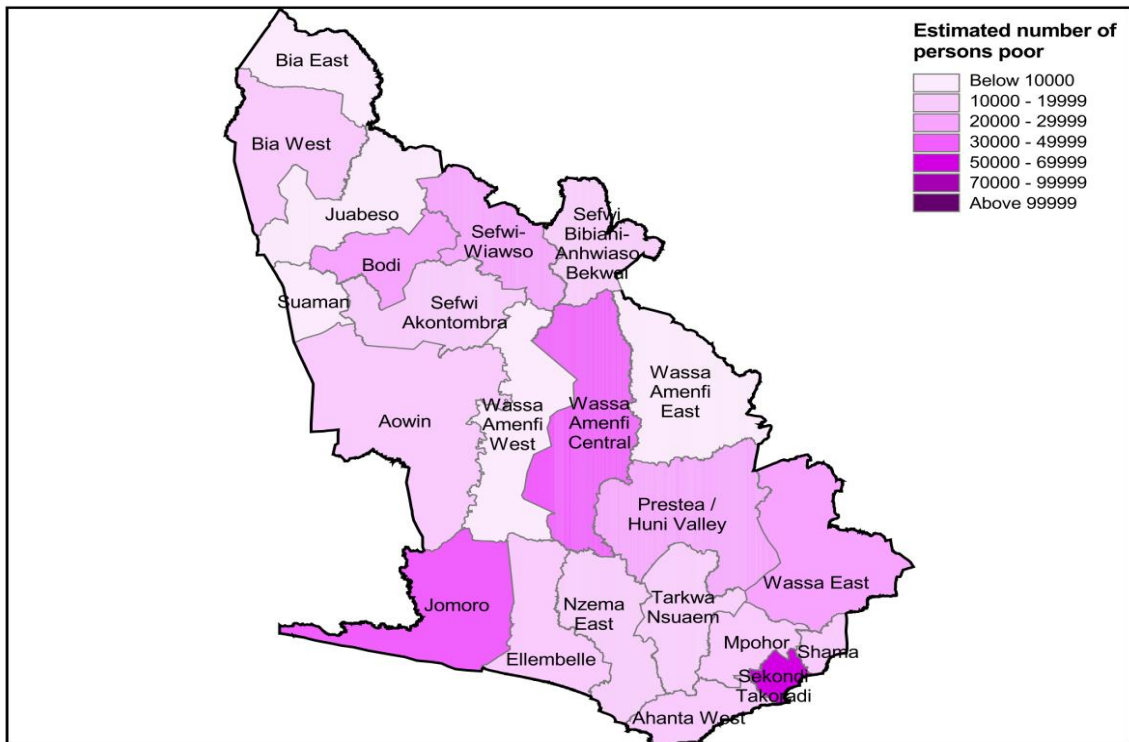

Figure 3.7: Poverty Depth - Western Region

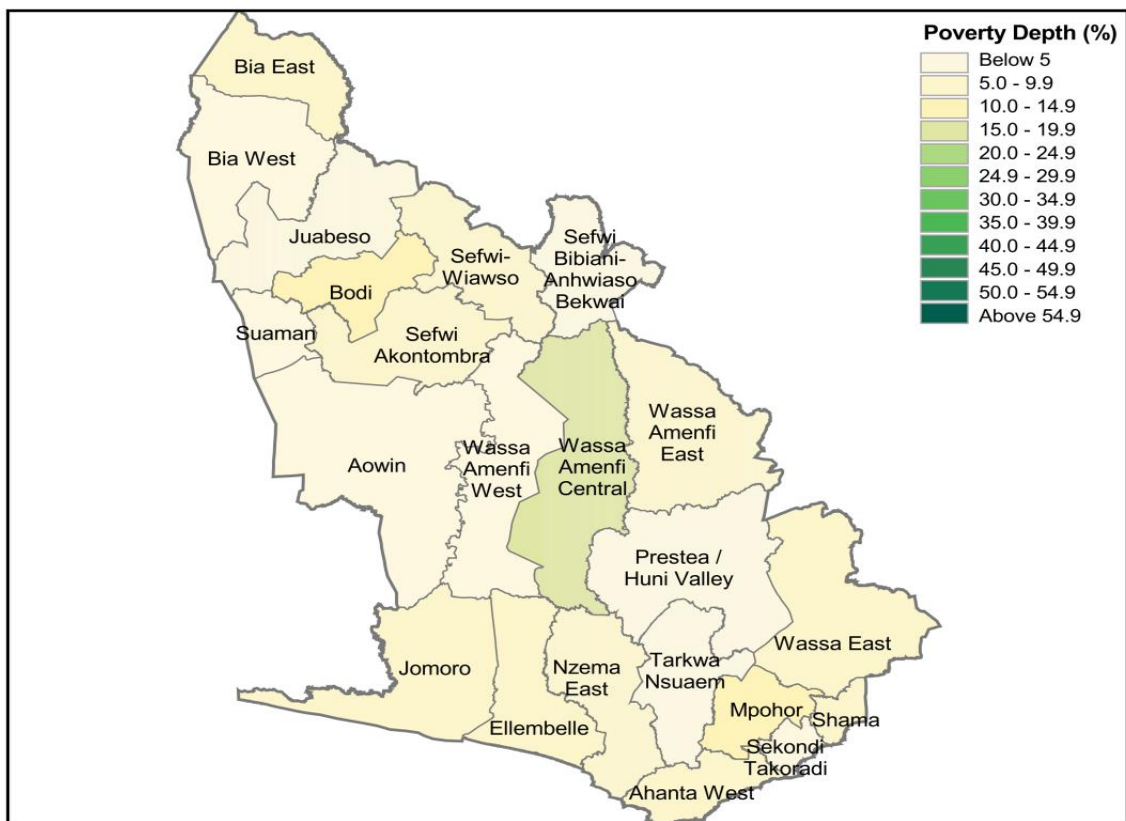

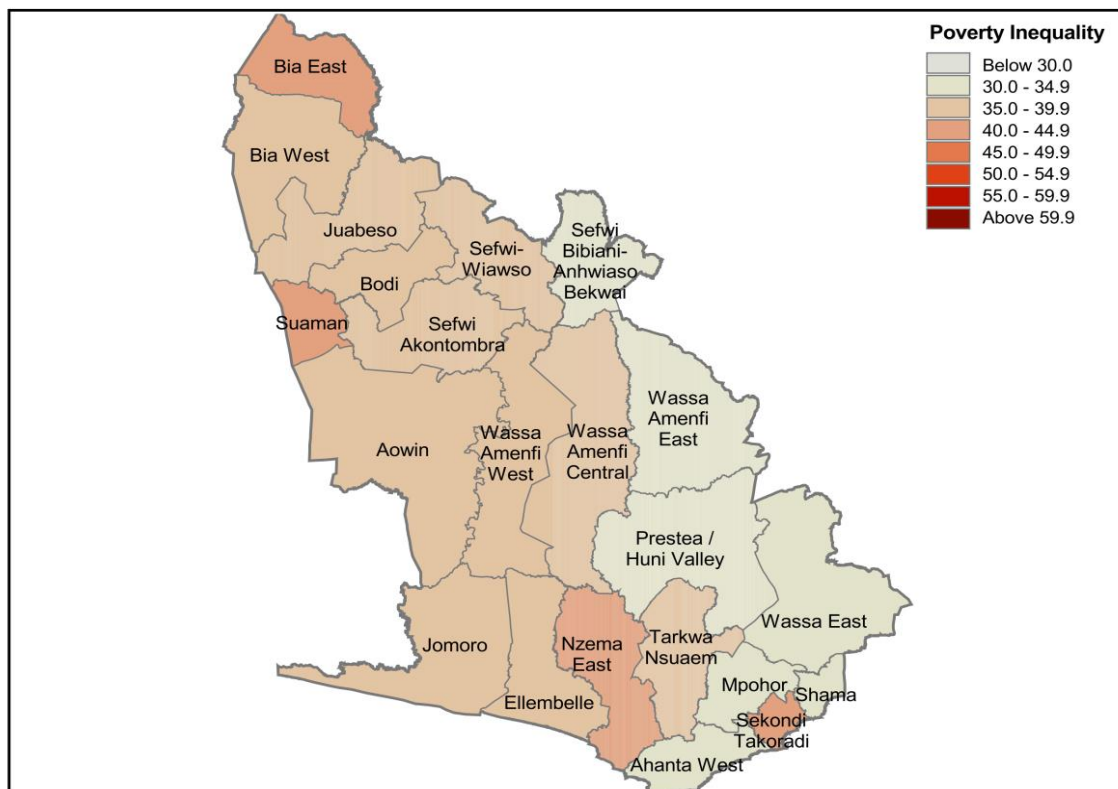

Figure 3.8: Poverty Inequality - Western Region

CENTRAL REGION

The Central Region currently has a total of 20 districts, consisting of one metropolis, six municipalities and 13 districts. The metropolitan area is further divided into two sub-districts. Table A1.2 and Figures 3.9 to 3.12 present poverty headcount and inequality estimates for the districts and sub-districts in the region. Eleven districts, including Ekumfi, Mfantseman, Agona East, Assin North Municipality and Awutu Senya East Municipality, have incidence and depth of poverty above the regional averages of 19.6 percent and 5.7 percent respectively (Table A1.2). Their headcount rates range between 20.3 and 48.4 percent with depth between 6.1 and 16.8 percent. Although Ekumfi district is the poorest in the region, it ranks 10th in the region in terms of the distribution of the poor population. Mfantseman (40,489), Assin North (38,443) and Abura Asebu Kwamankese (31,022) districts have the highest number of poor persons in the region.

Inequality is lower in all the districts compared to the regional average (42.0) with the exception of Awutu Senya East Municipality (42.6). Agona East reported the least level of inequality (34.7).

Cape Coast Metropolis has the least incidence and depth of poverty in the region (2.6% for incidence and 0.7% for depth) while at the sub-district level, poverty and inequality are higher in Cape Coast South (2.7% and 37.9 respectively) than in Cape Coast North (2.3% and 36.3 respectively).

Figure 3.9: Poverty Incidence - Central Region

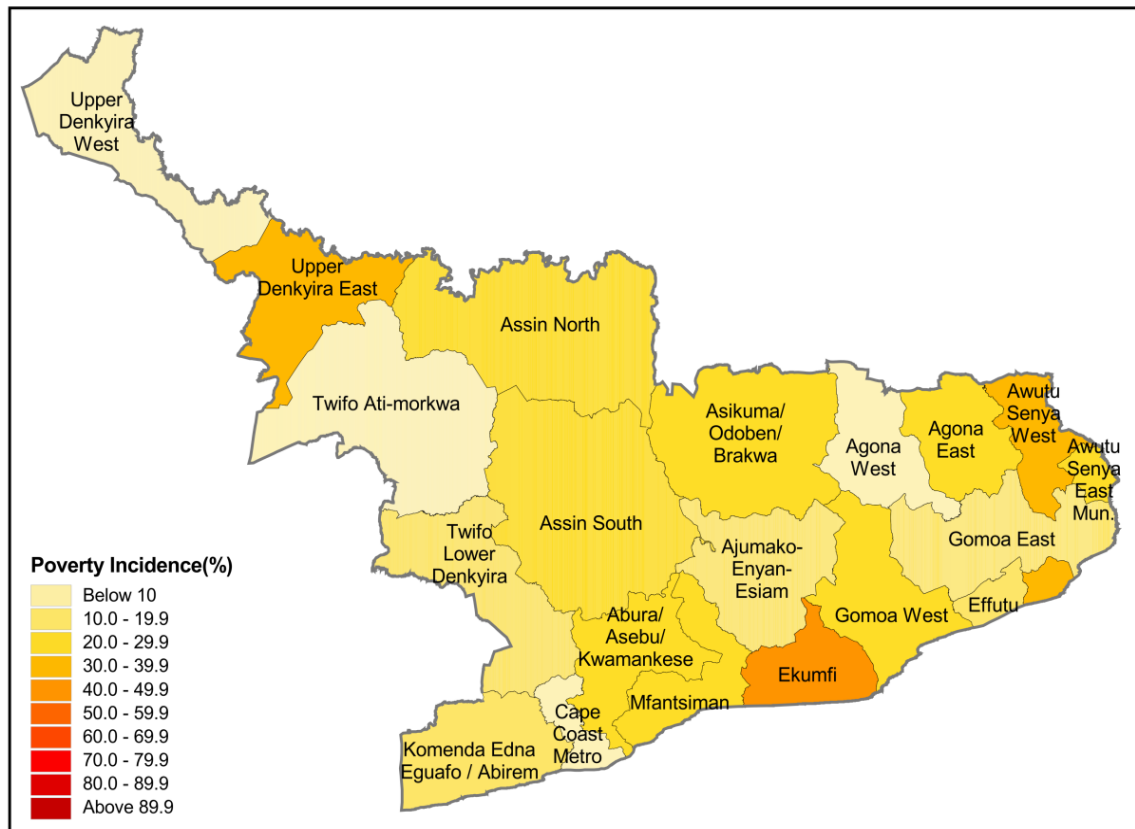

Figure 3.10: Estimated Number of Poor Persons - Central Region

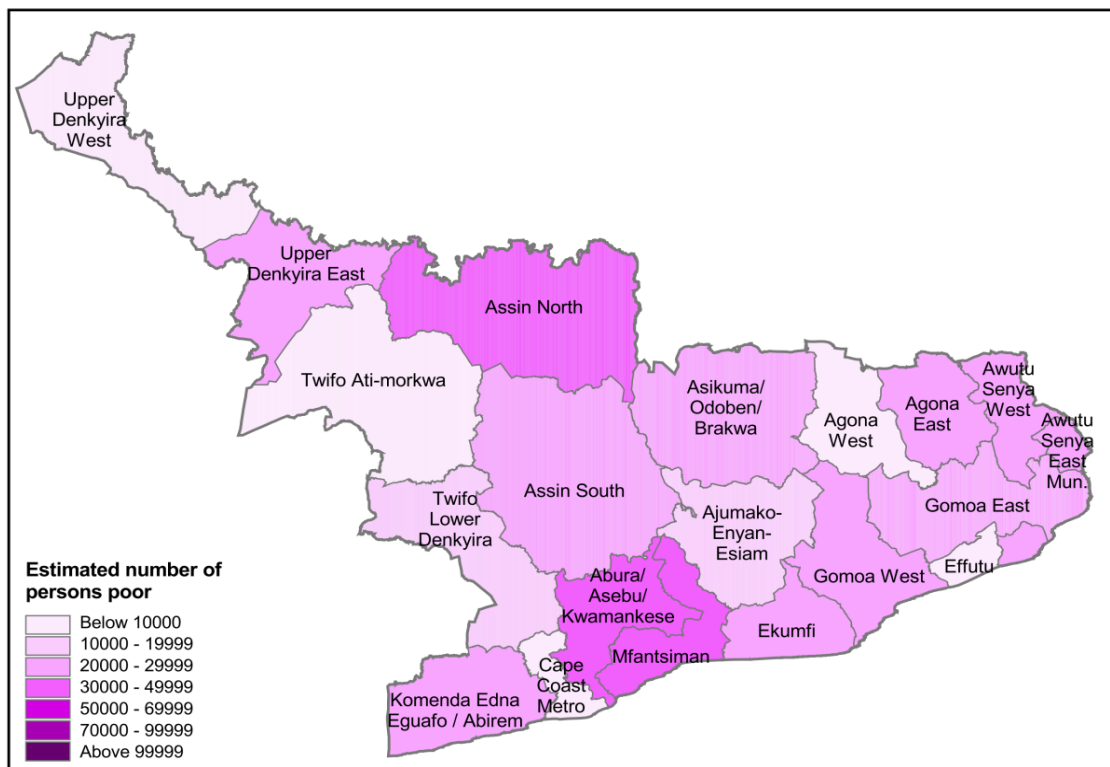

Figure 3.11: Poverty Depth - Central Region

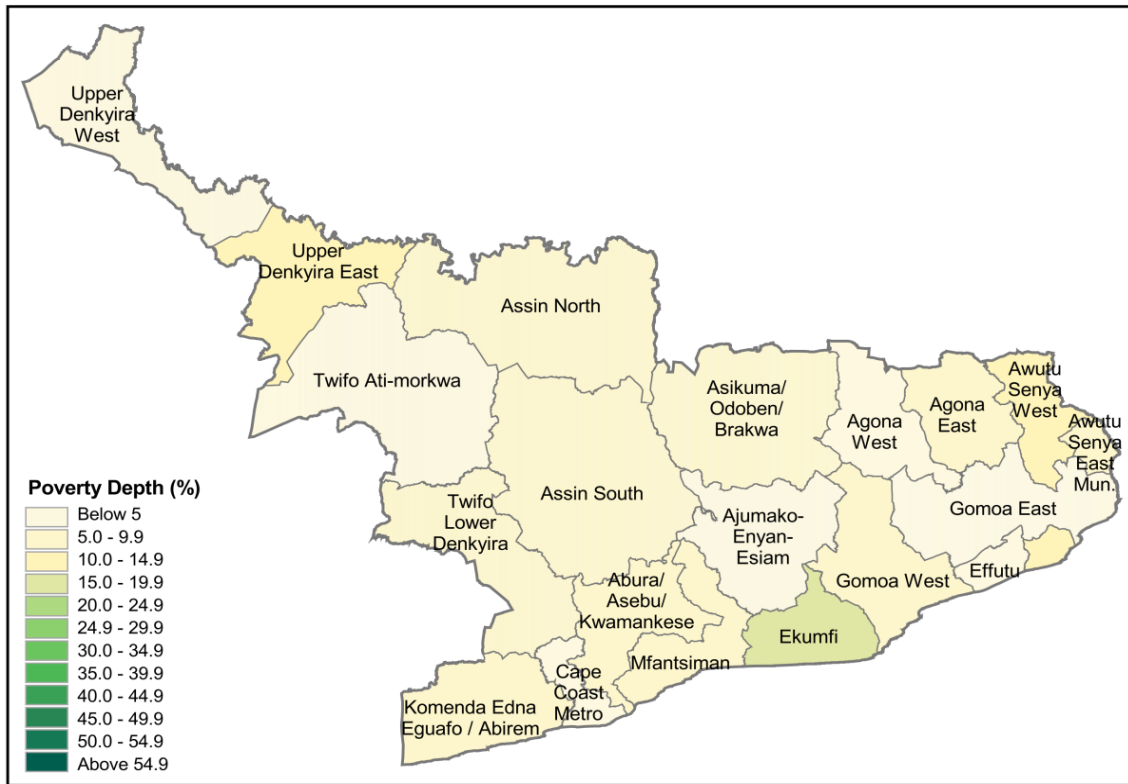

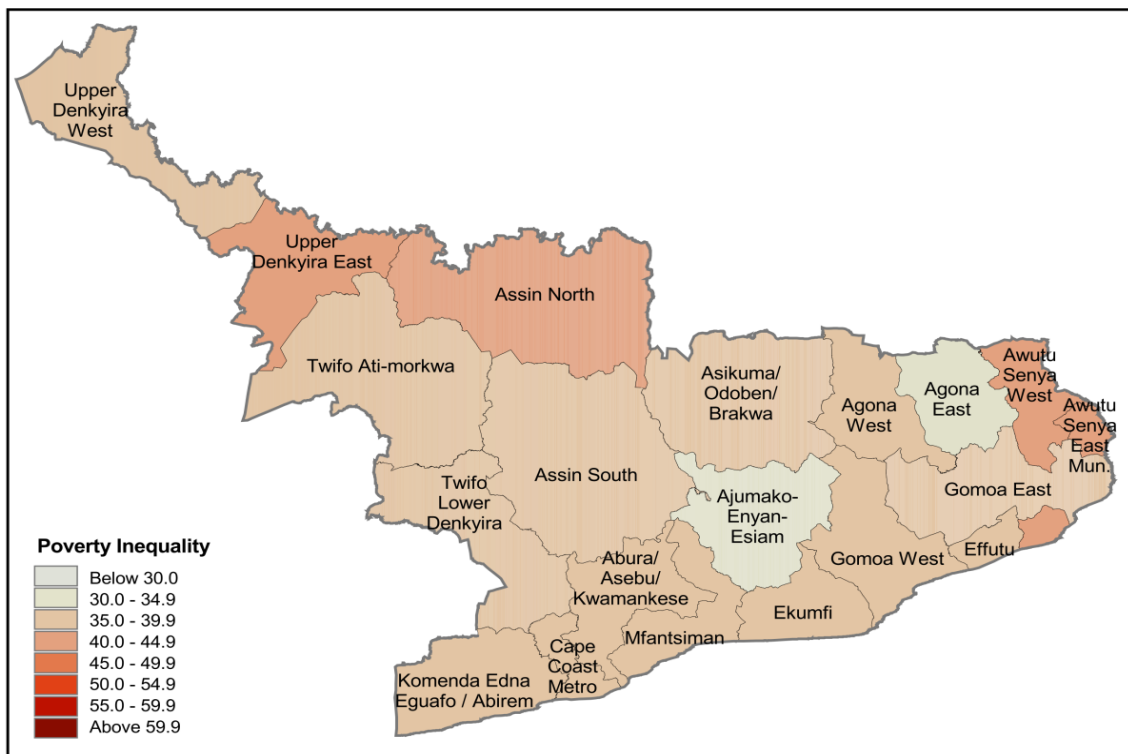

Figure 3.12: Poverty Inequality - Central Region

GREATER ACCRA REGION

Greater Accra region has very low levels of poverty incidence (6.6%) and poverty depth (1.8%). Table A1.3 and Figures 3.13 to 3.16 show that there are significant variations in the incidence and depth of poverty among the 16 districts. La Dade Kotopon Municipal (1.3%), Accra Metropolis (2.6%) and La Nkwantanang Madina (2.8%) have the lowest poverty incidence. Two districts in the region, Shai Osudoku (55.1%) and Ningo Prampram (31.2%), have rates more than four times the regional average.

In terms of depth of poverty, La Dade Kotopon Municipal (0.3%), Accra Metropolis (0.6%) and La Nkwantanang Madina Municipal (0.6%) recorded the lowest rates. Shai Osudoku (23.2%) has the highest poverty depth followed by Ningo Prampram (10.1%) and Ga South Municipal (4.3%).

The distribution of inequality in the region indicates that Shai Osudoku has the highest (40.1), and is the only district with inequality above the regional average of 37.6. Ga South Municipal has the highest number of poor persons (61,347) in the region.

Among the sub districts, poverty incidence is highest in Tema West (9.7%) while Okaikoi North (0.7%) has the lowest. The two sub districts rank the same in terms of poverty depth. Inequality is highest in Tema East (36.9) while Ayawaso West Wogon has the lowest (32.8). Tema West (13,383) has the highest number of poor persons, with the least being Ayawaso West Wogon (452).

Figure 3.13: Poverty Incidence - Greater Accra Region

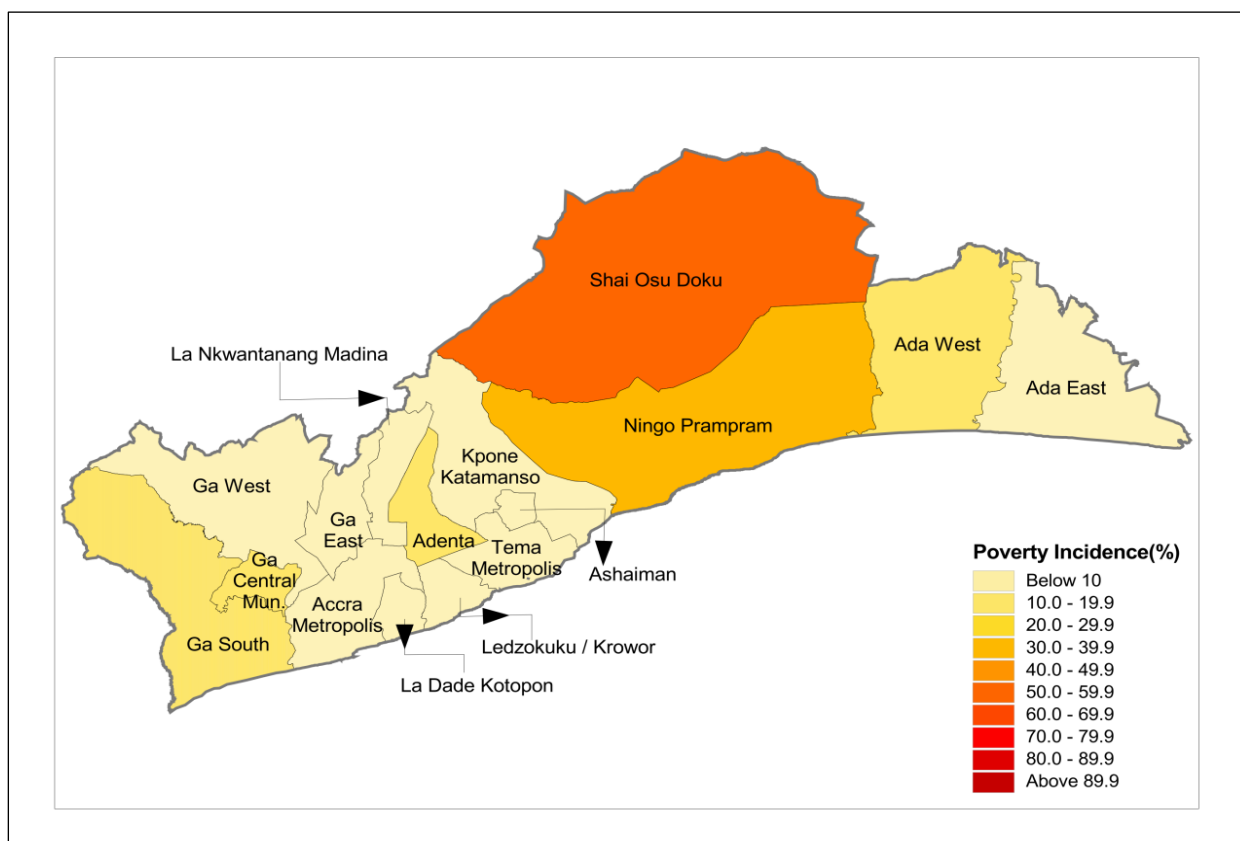

Figure 3.14: Estimated Number of Poor Persons - Greater Accra Region

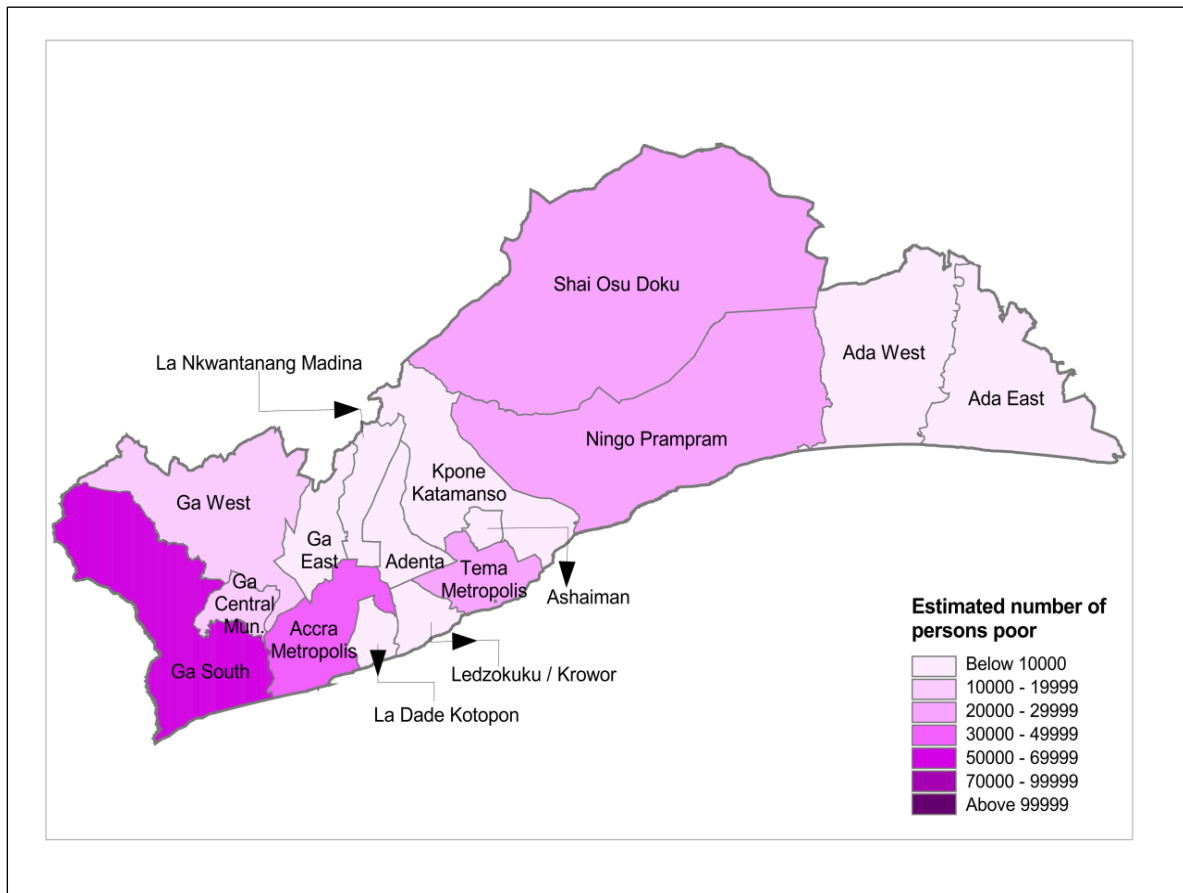

Figure 3.15: Poverty Depth – Greater Accra Region

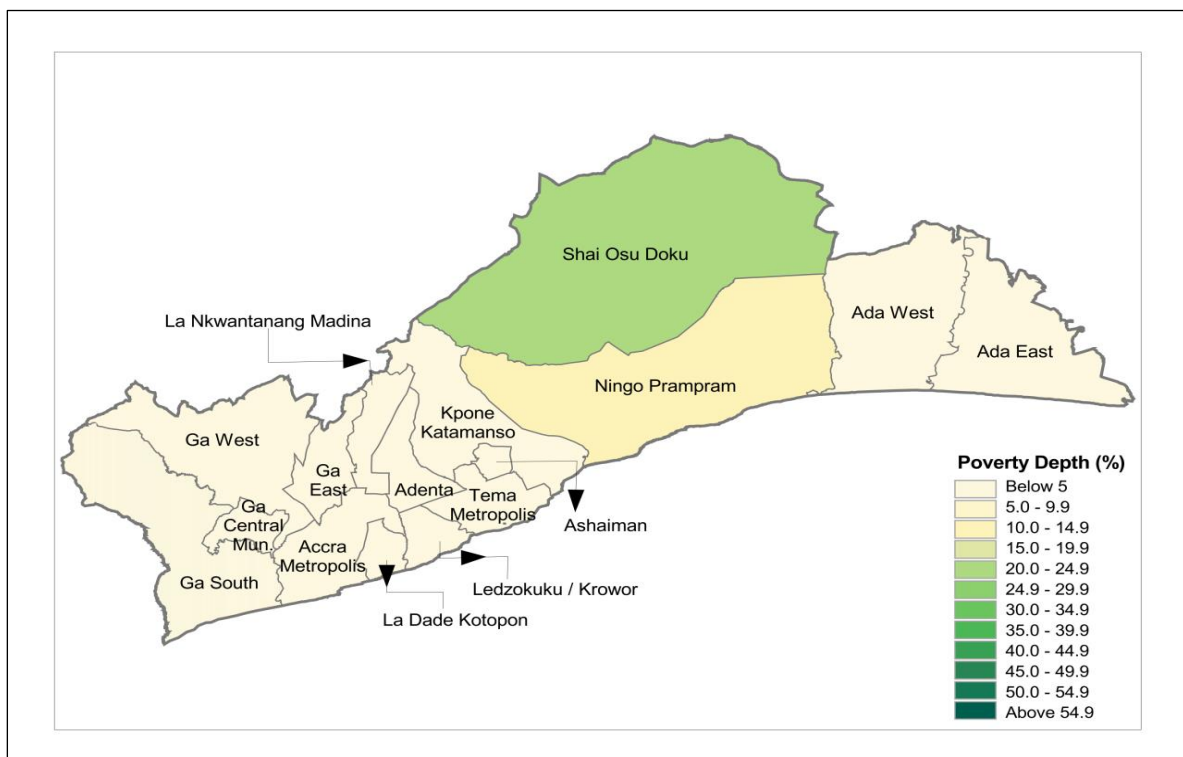

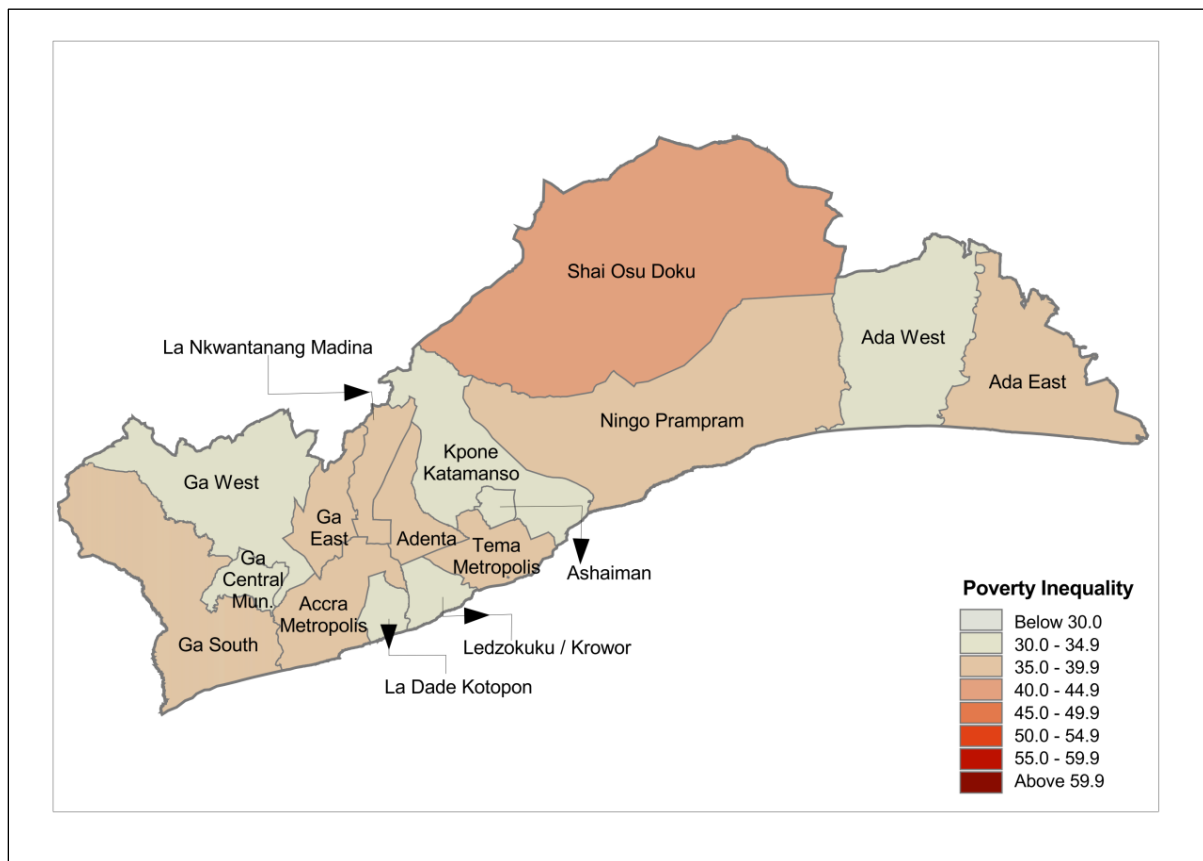

Figure 3.16: Poverty Inequality - Greater Accra Region

VOLTA REGION

Poverty incidence, depth of poverty and inequality in the Volta Region are presented in Table A1.4 and Figures 3.17 to 3.20. The results reveal that there exist high variations in the levels of poverty among the 25 districts in the region. More than half (13 out of 25) of the districts have poverty incidence higher than the regional average of 33.3 percent. The incidence of poverty is highest in Adaklu (89.7%), followed by Kadjebi (66.8%), and Agortime Ziope (62.1%) districts. The lowest poverty headcount is observed in Akatsi South District (10.5%).

Adaklu District has the highest depth of poverty (46.9%), followed by Kadjebi (30.1%) and Agortime Ziope (24.2%) districts. The lowest depth of poverty is recorded in Akatsi South District (2.6%).

Six of the 25 districts have inequality above the regional value of 43.7. These districts are: North Tongu (46.0), Biakoye (45.0), Kpando Municipal (44.4), Jasikan (44.0) and Nkwanta North (44.1). Adaklu District (32.2), however, recorded the lowest inequality in the region.

Krachi East District (58,329) has the highest number of poor persons in the region, followed by Hohoe Municipal (51,976) and North Tongu District (45,899). Akatsi North District recorded the lowest number of poor persons (7,835).

Figure 3.17: Poverty Incidence - Volta Region

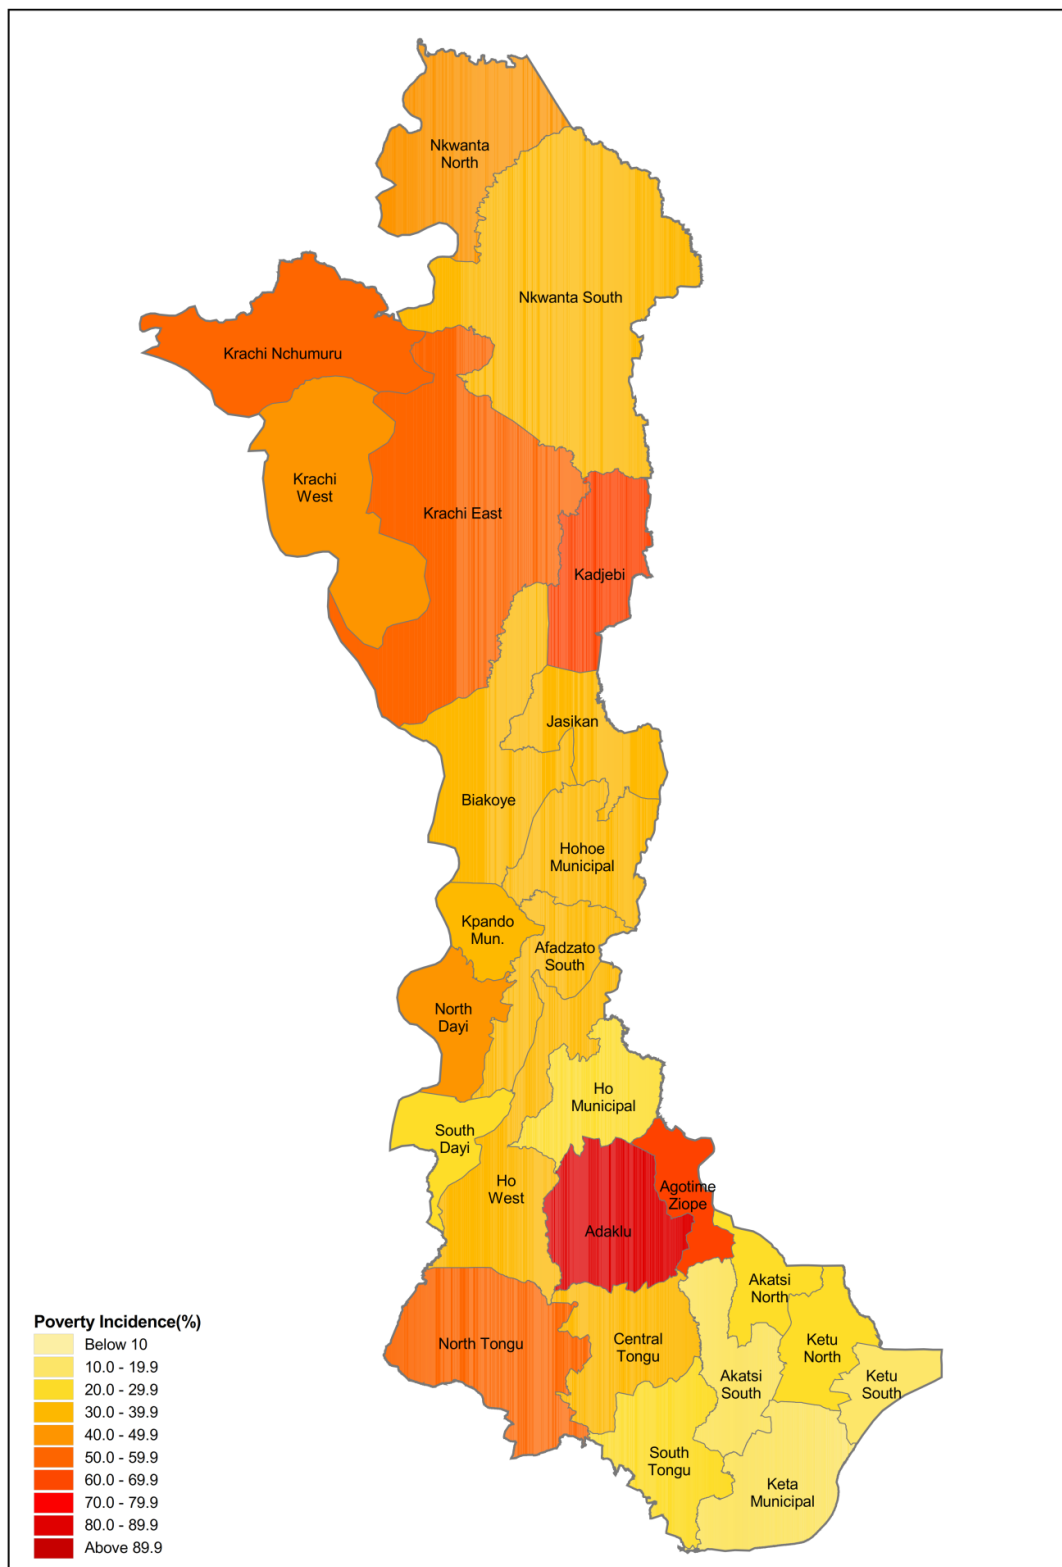

Figure 3.18: Estimated Number of Poor Persons - Volta Region

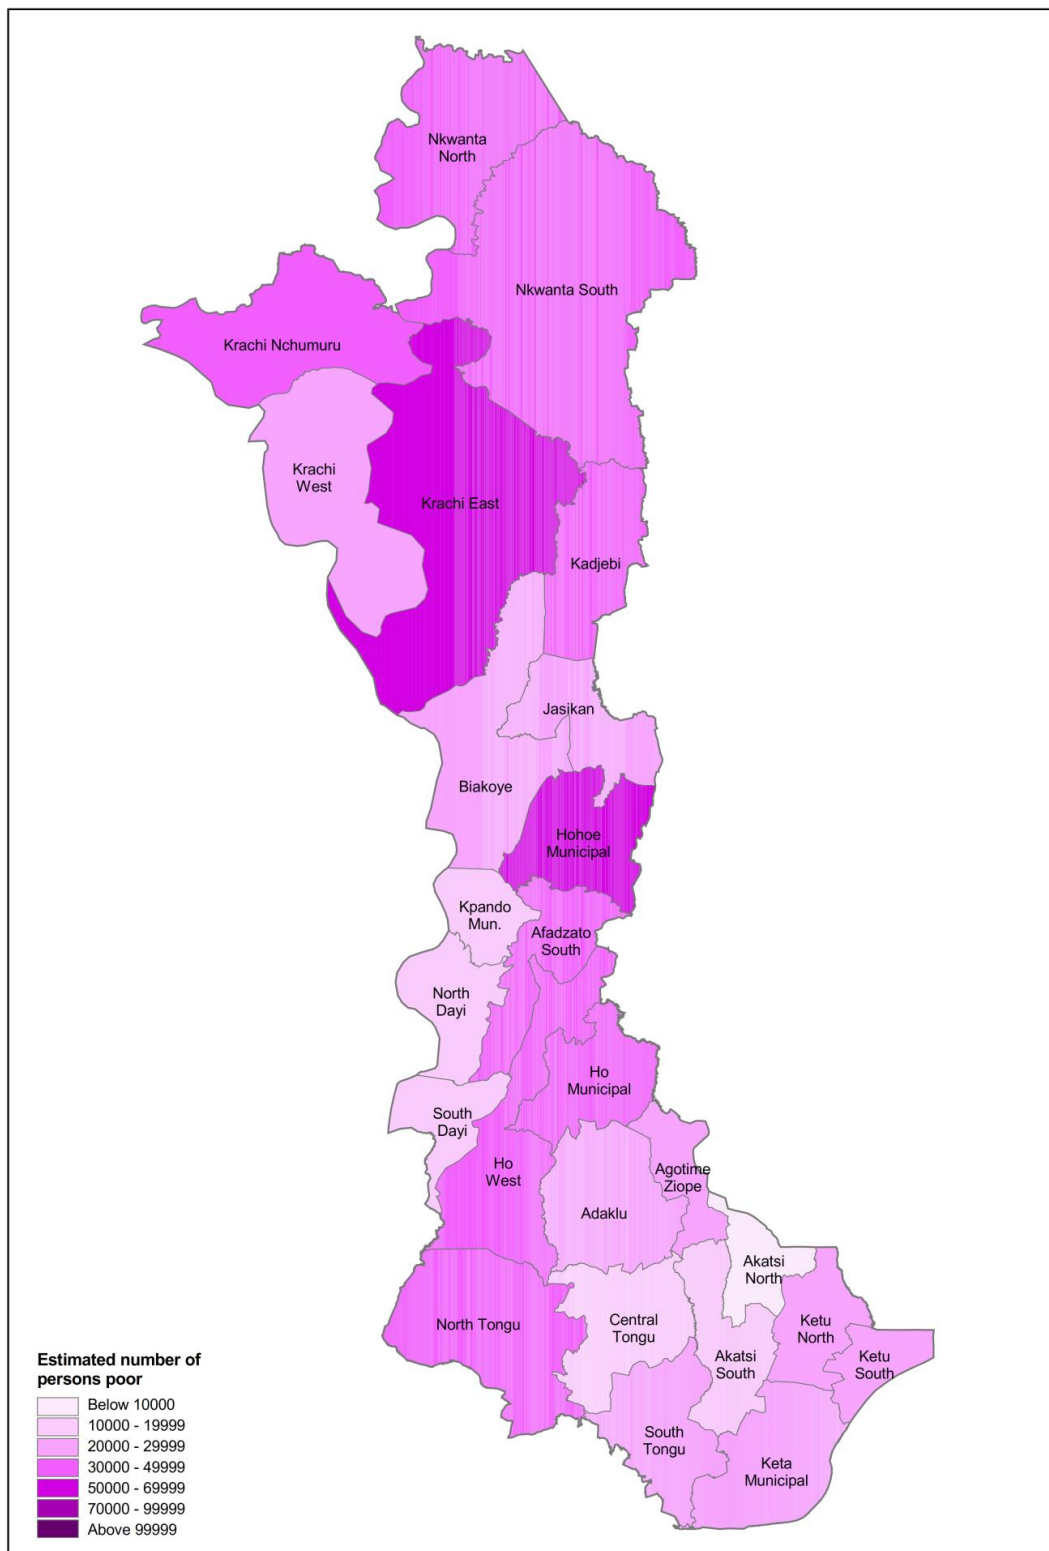

Figure 3.19: Poverty Depth – Volta Region

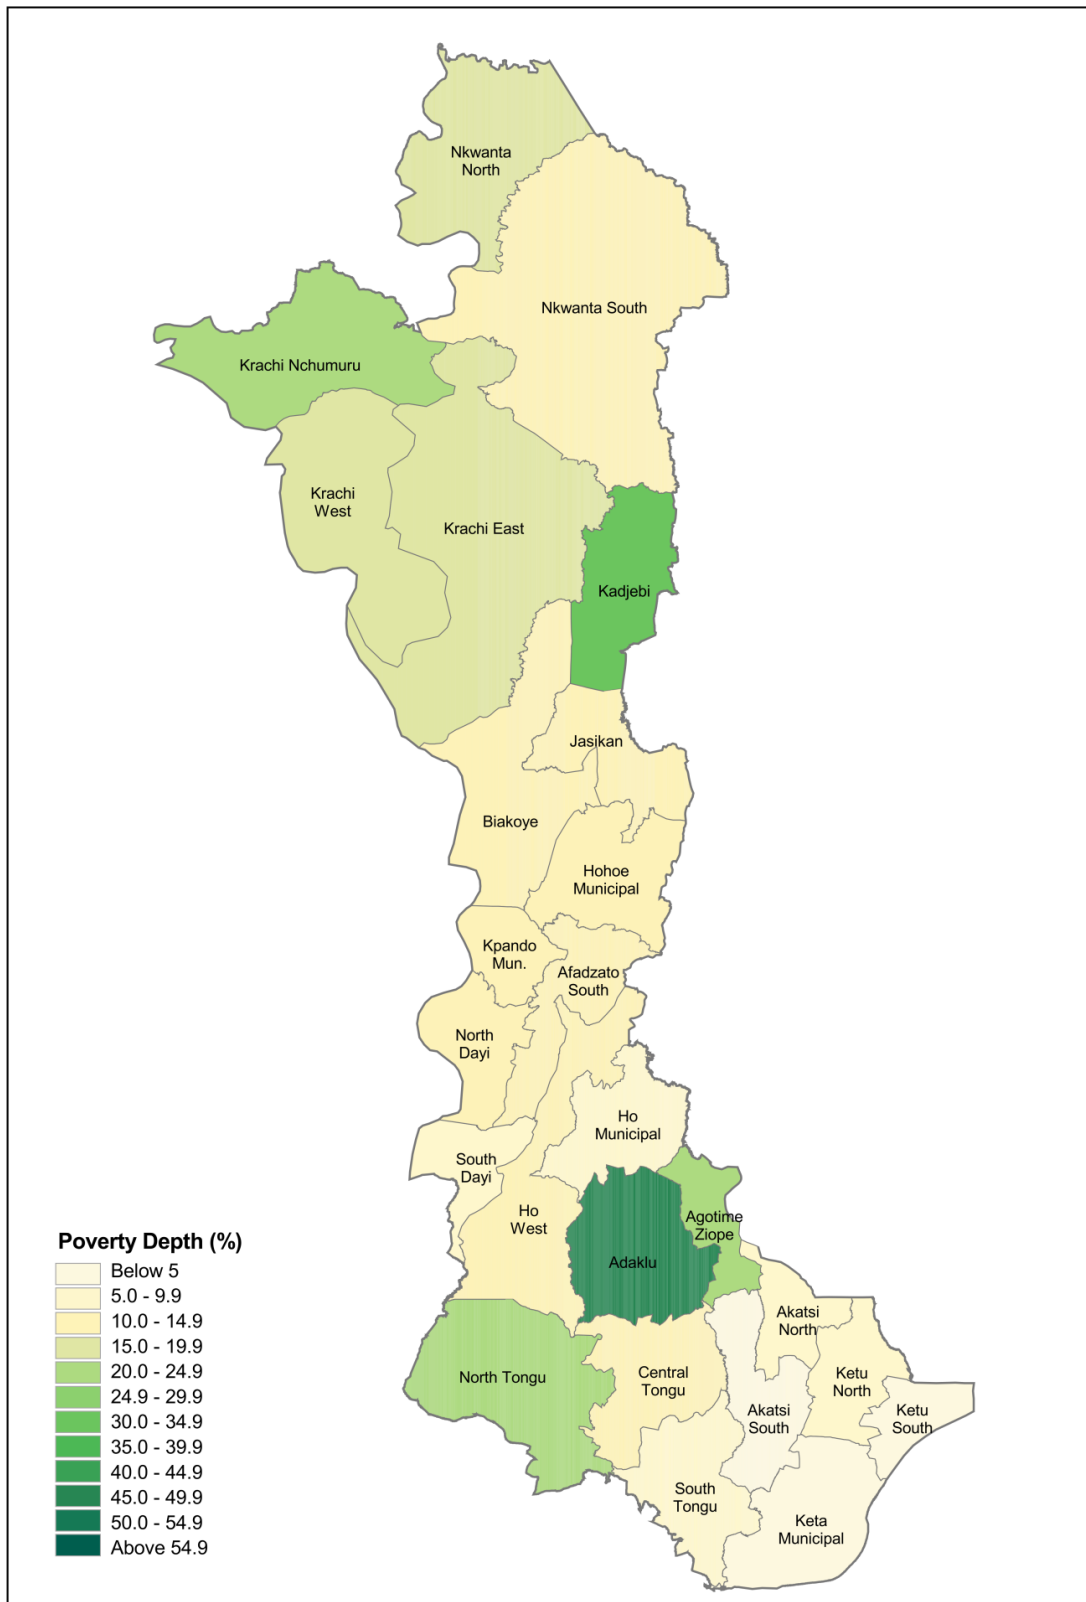

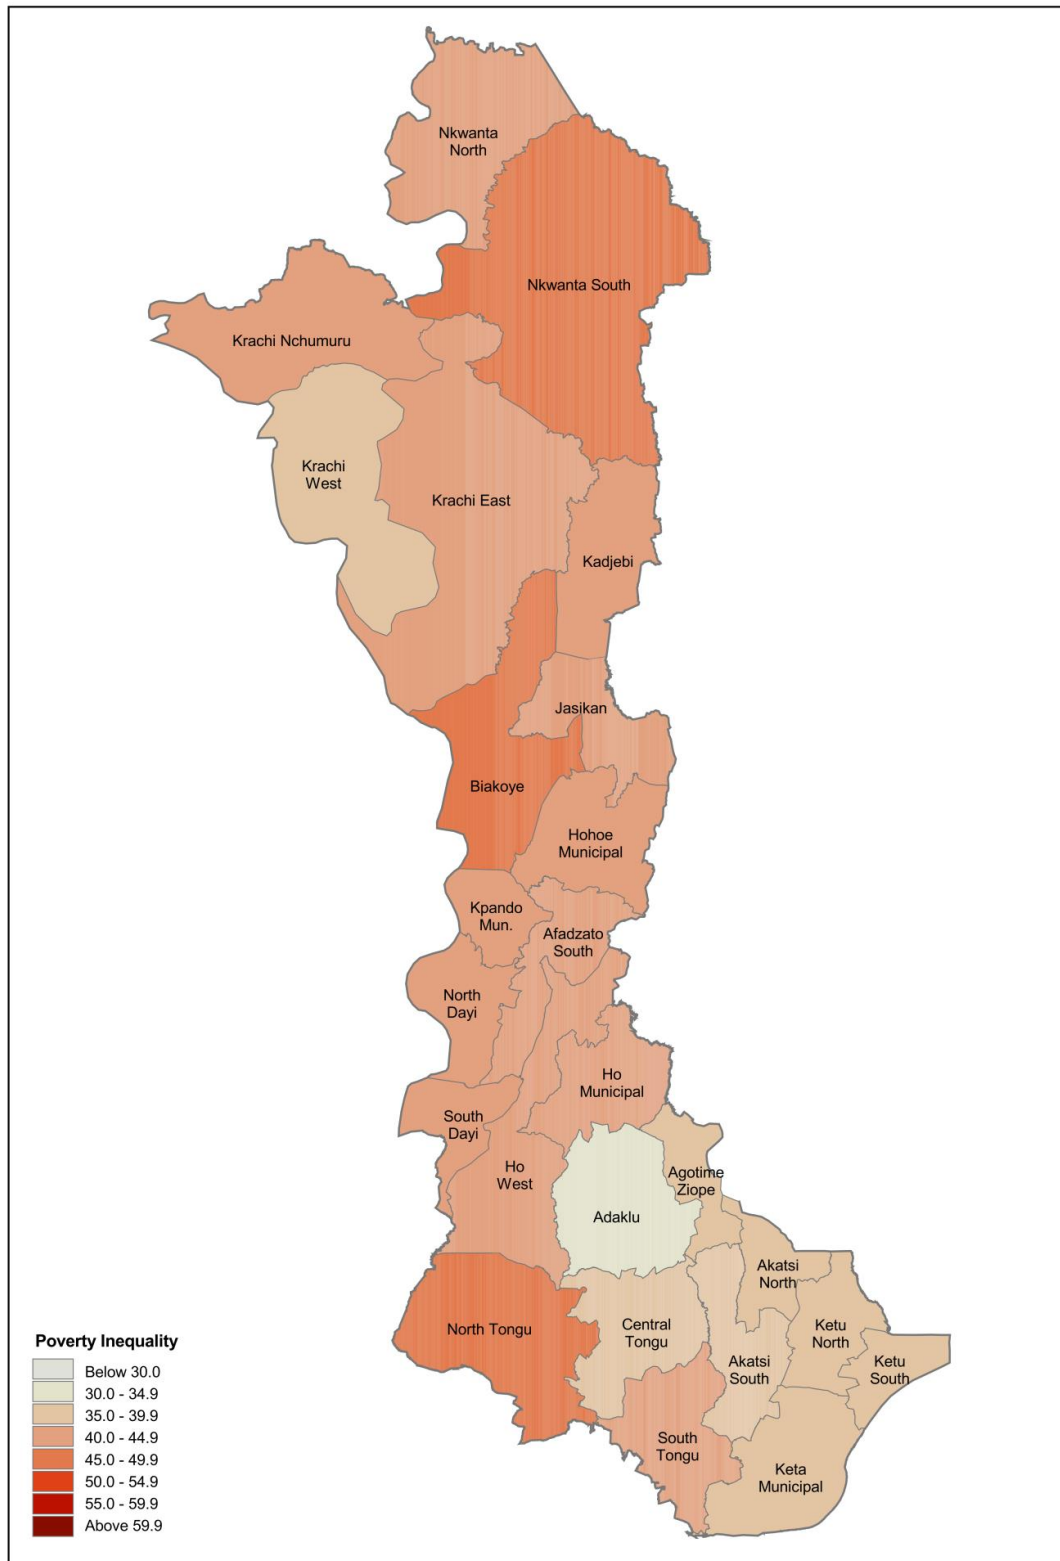

Figure 3.20: Poverty Inequality - Volta Region

EASTERN REGION

There are high variations in poverty rates among districts in the Eastern region. Table A1.5 and Figures 3.21, 3.22 and 3.23 present the distribution of poverty headcounts, depth of poverty and inequality for the 26 districts in the region. The incidence of poverty ranges from 4.6 percent in New Juaben Municipal to 59.7 percent in Kwahu Afram Plains South District. Eleven districts have poverty incidence higher than the regional average of 22.0 percent.

Denkyembuor District and New Juaben Municipal have the lowest poverty depth of 1.1 percent, followed by Nsawam Adoagyiri Municipal and Suhum Municipal with 1.4 percent. The three districts with the lowest inequality are Upper Manya (27.2), Lower Manya (28.3) and Yilo Krobo (29.1).

Kwahu Afram Plains South has the highest number of poor persons (67,555) in the region and Denkyembuor District the lowest (3,559).

Figure 3.21: Poverty Incidence - Eastern Region

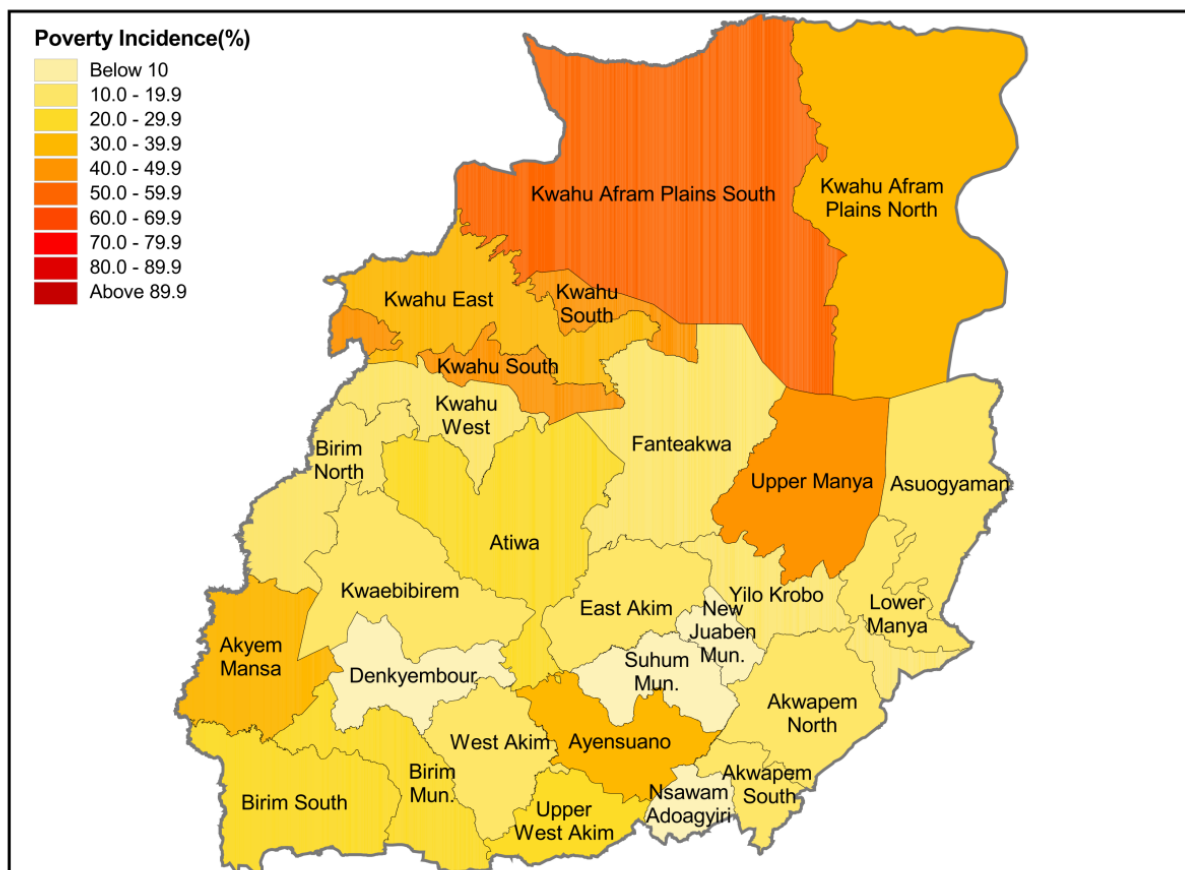

Figure 3.23: Estimated Number of Poor Persons - Eastern Region

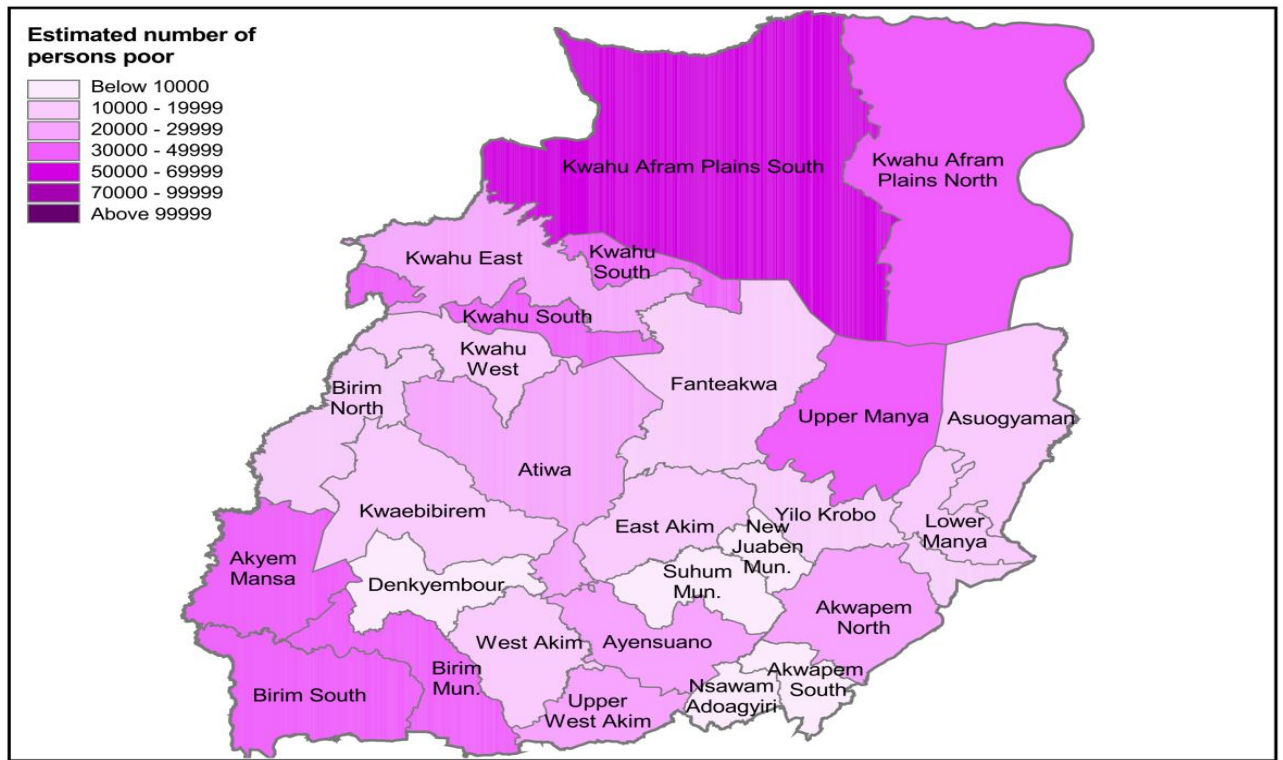

Figure 3.23: Poverty Depth – Eastern Region

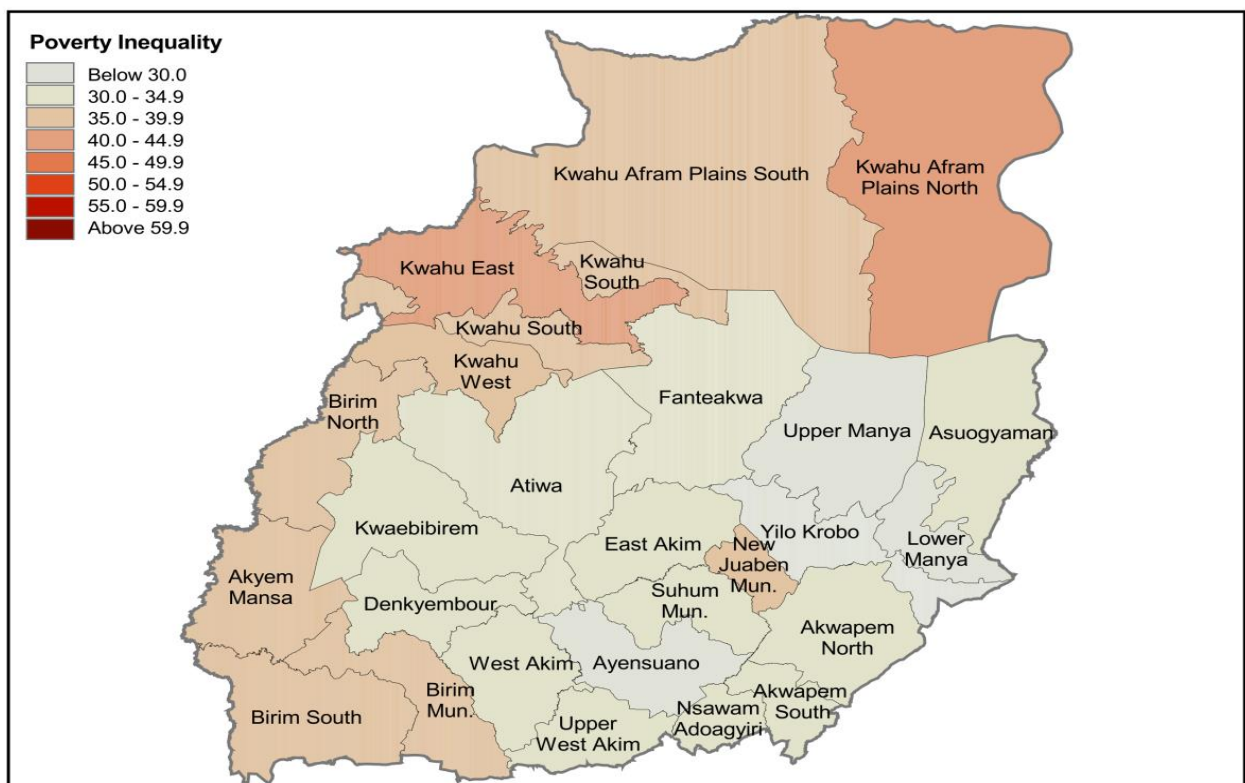

Figure 3.24: Poverty Inequality - Eastern Region

ASHANTI REGION

There are variations in poverty incidence, depth of poverty and inequality among districts in the Ashanti Region as presented in Table A1.6 and Figures 3.25 to 3.28.

Sekyere Afram Plains North (59.6%) recorded the highest poverty incidence, followed by Ejura Sekyedumasi (47.0%) and Ahafo Ano North (46.4%) districts. Asokore Mampong Municipal (3.3%), Afigya Kwabre (4.0%) and Atwima Kwanwoma (4.9%) have relatively low poverty incidence in the region.

Variations also exist in depth of poverty among the districts in the region. Asokore Mampong Municipal has the lowest rate of 0.7 percent, while the highest is in Sekyere Afram Plains North (24.3%). With the exception of Sekyere Afram Plains North (49.8) and Obuasi Municipal (38.0), inequality in all other districts is lower than the regional average of 37.3. Though Sekyere Afram Plains North has the highest poverty incidence in the region, Kumasi Metropolis (88,935) has the highest number of poor persons followed by Ahafo Ano North District (43,070).

Figure 3.25: Poverty Incidence - Ashanti Region

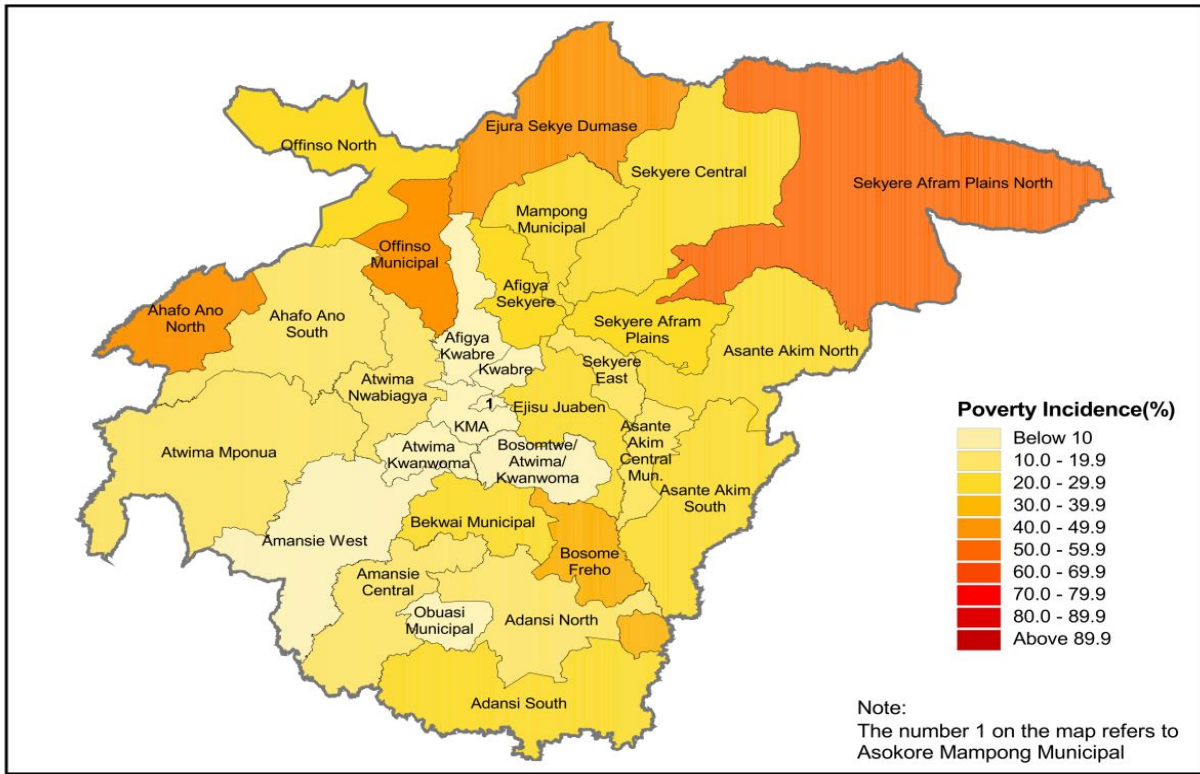

Figure 3.26: Estimated Number of Poor Persons - Ashanti Region

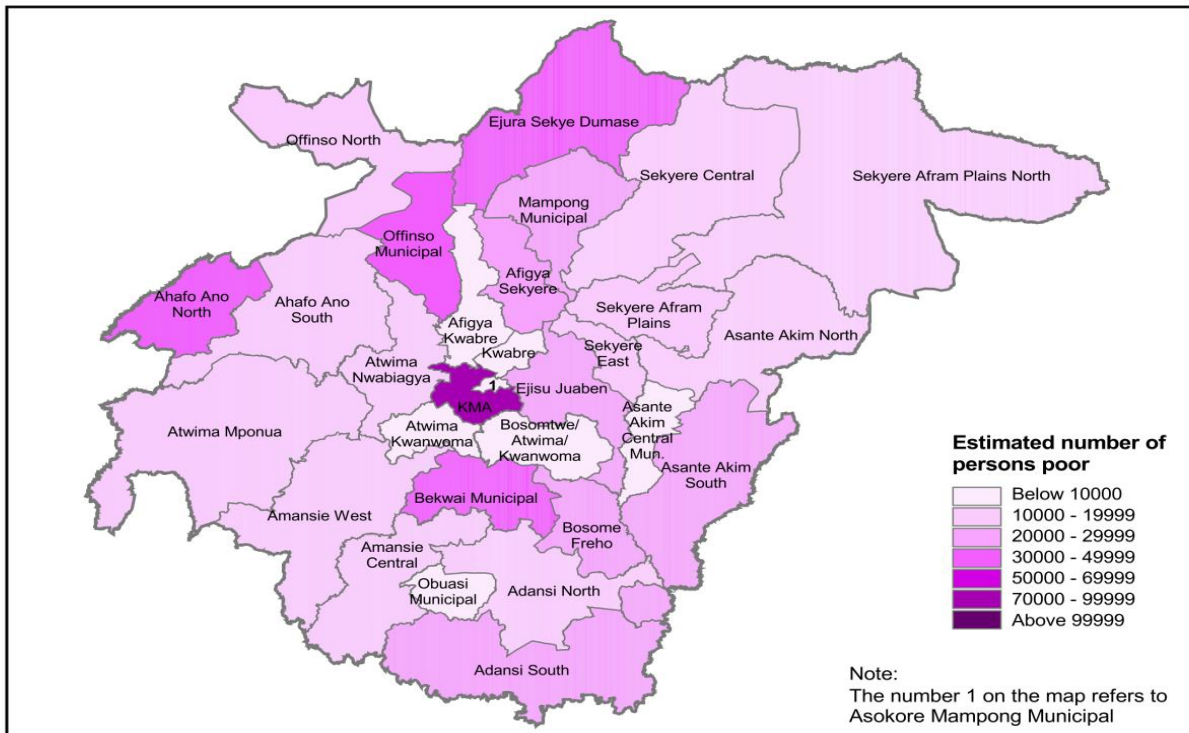

Figure 3.27: Poverty Depth – Ashanti Region

Figure 3.28: Poverty Inequality - Ashanti Region

BRONG AHAFO REGION

Brong Ahafo Region has districts located in both the Savannah and Forest ecological zones. More than half (15 out of 27) of the districts in the region have poverty incidence higher than the regional average of 28.6 percent as shown in Table A1.7 and Figures 3.29 to 3.32. Kintampo South (78.3%) and Banda (78.0%) districts, both in the Savannah ecological zone, have the highest poverty incidence.

The districts with the lowest incidence of poverty are found within the forest ecological zone. These are Dormaa West District (9.9%), Dormaa Municipal (11.4%) and Asunafo North Municipal (12.0%). In terms of the population classified as poor, Kintampo South (62,893) has the highest in the region, followed by Pru District (54,818). Dormaa West District (4,639) has the least number of poor persons.

Banda (37.9%) and Kintampo South (35.8%) districts recorded the highest depth of poverty while Dormaa West District (2.5%) has the lowest. With regard to inequality, Sunyani Municipal (64.0) has the highest while the lowest is observed in Kintampo South (35.9).

Figure 3.29: Poverty Incidence – Brong Ahafo Region

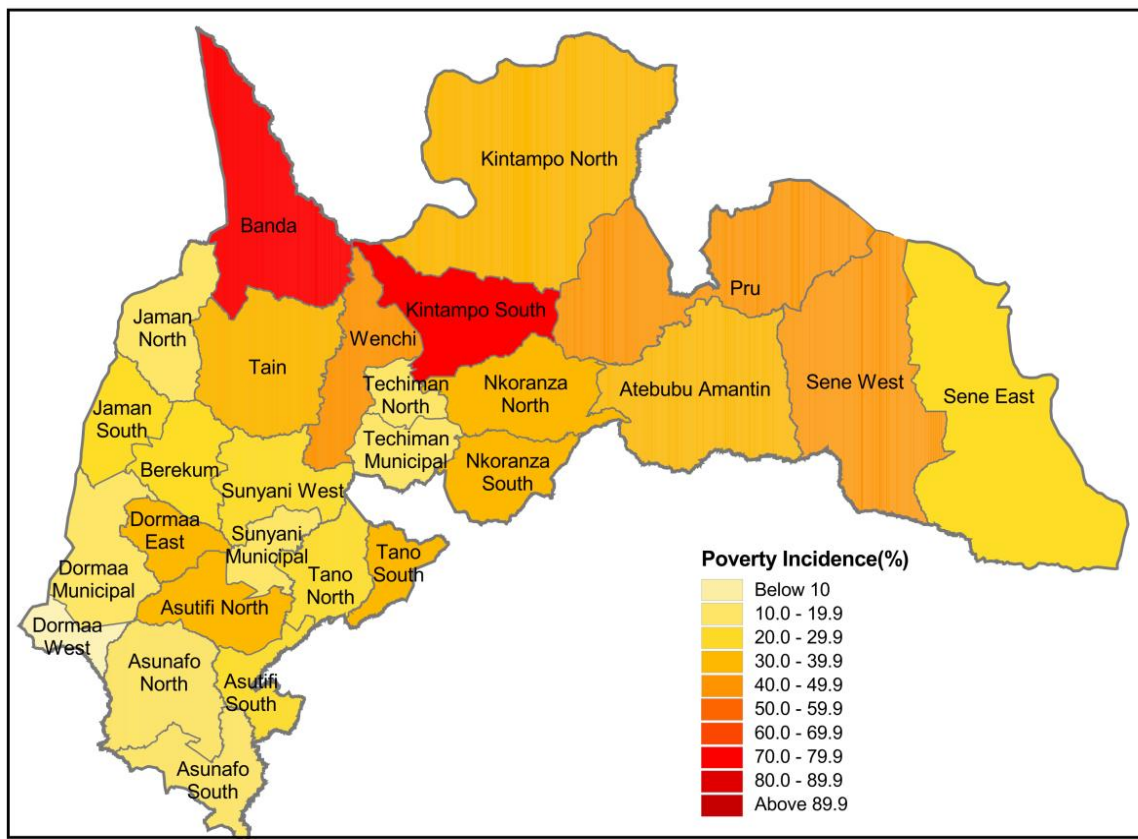

Figure 3.30: Estimated Number of Poor Persons - Brong Ahafo Region

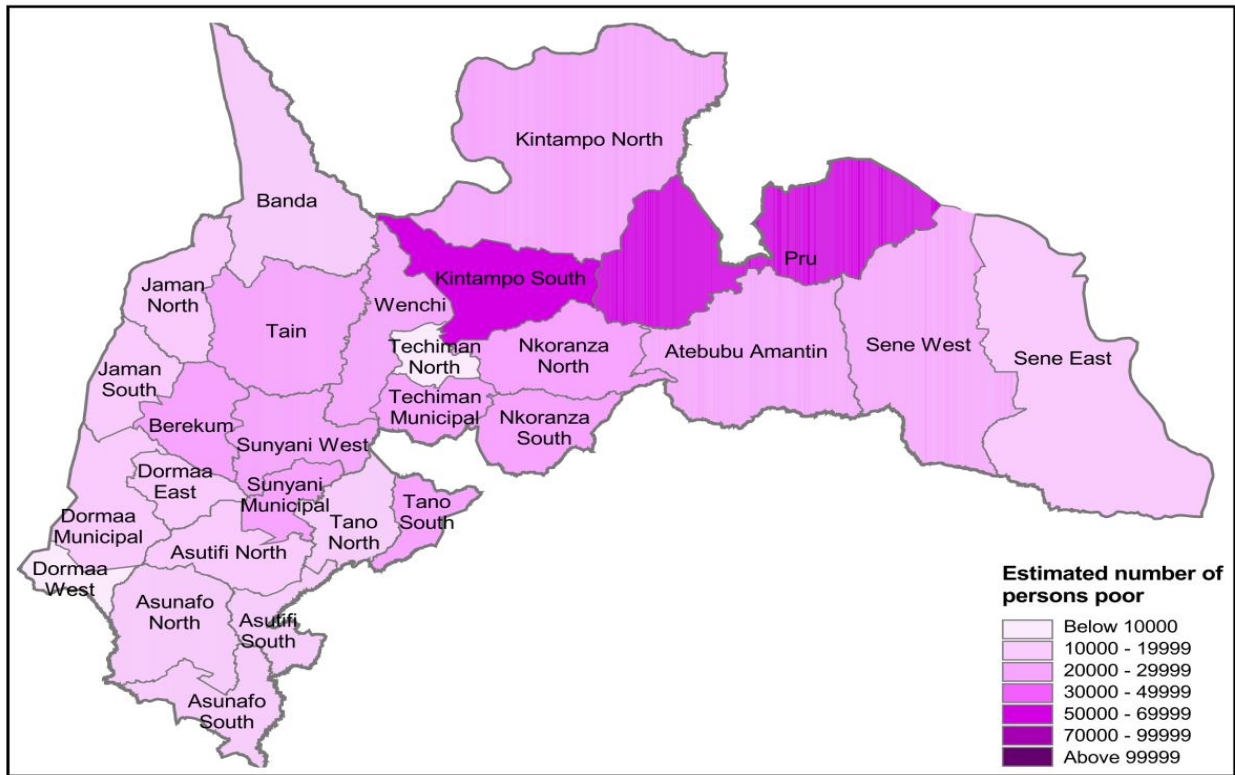

Figure 3.31: Poverty Depth – Brong Ahafo Region

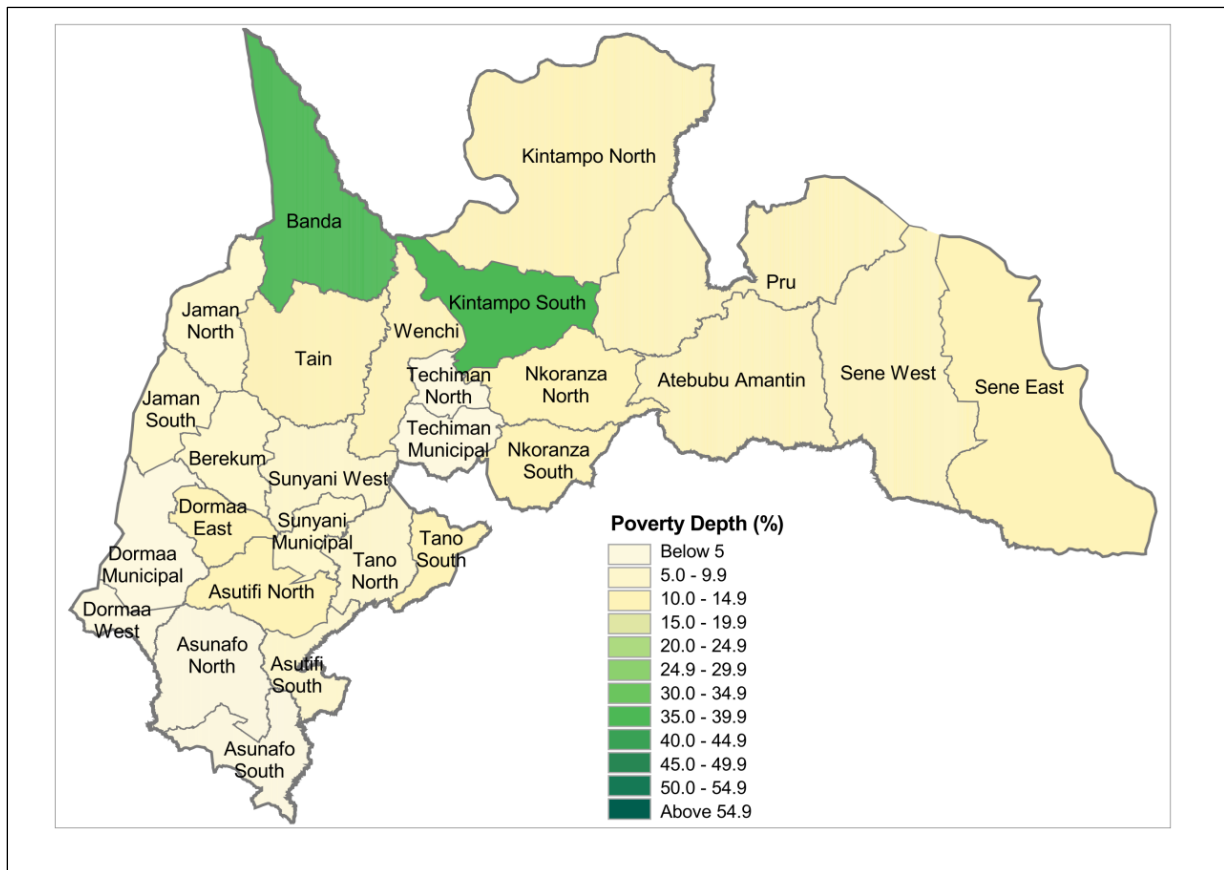

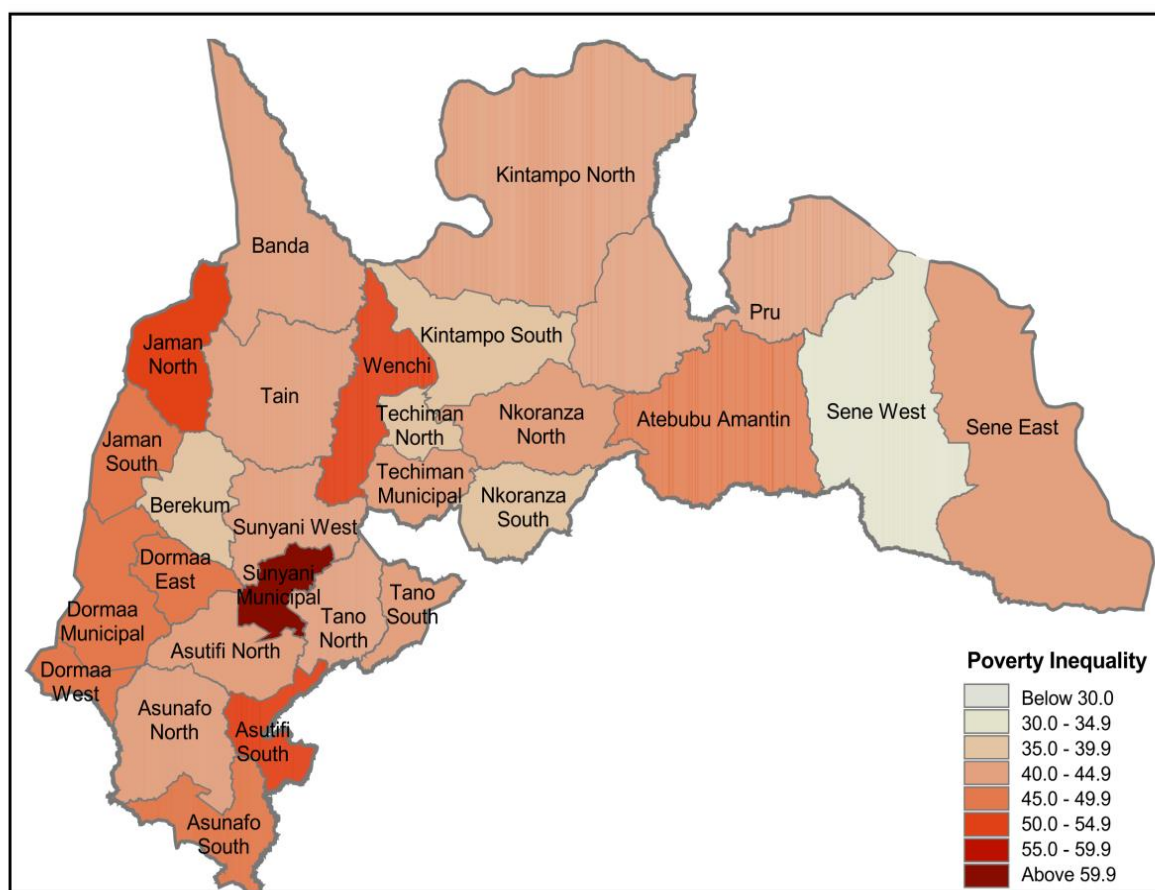

Figure 3.32: Poverty Inequality - Brong Ahafo Region

NORTHERN REGION

The estimates of poverty for the 25 districts and two sub-districts in the Northern Region are presented in Table A1.8 and Figures 3.33 to 3.6. Eleven of the districts have poverty incidence higher than the regional average of 44.2 percent. The highest is East Gonja (84.2%), followed by Bole (79.4%) and Kpandai (76.9%) districts. The incidence is lowest for Tamale Metropolis (24.6%) and Sagnerigu Municipal (29.3%).

Depth of poverty in the Northern Region is 15.5 percent. The rate is highest in East Gonja (41.0%), followed by Bole (38.1%) district. Tamale Metropolis (6.8%), Sagnerigu Municipal (8.2%) and Nanumba North District (8.9%) recorded the lowest depth of poverty.

The region ranked fourth in terms of inequality in the country. Inequality is high in the Bole (45.5) and Zabzugu (39.1) districts, but low in Gonja Central (30.0) and Chereponi (30.0) districts.

The districts that dominate in terms of the number of poor persons are East Gonja (112,130), Kpandai (82,712), Bunkpurugu Yonyo (66,444) and Sawla-Tuna-Kalba (61,780).

Figure 3.33: Poverty Incidence – Northern Region

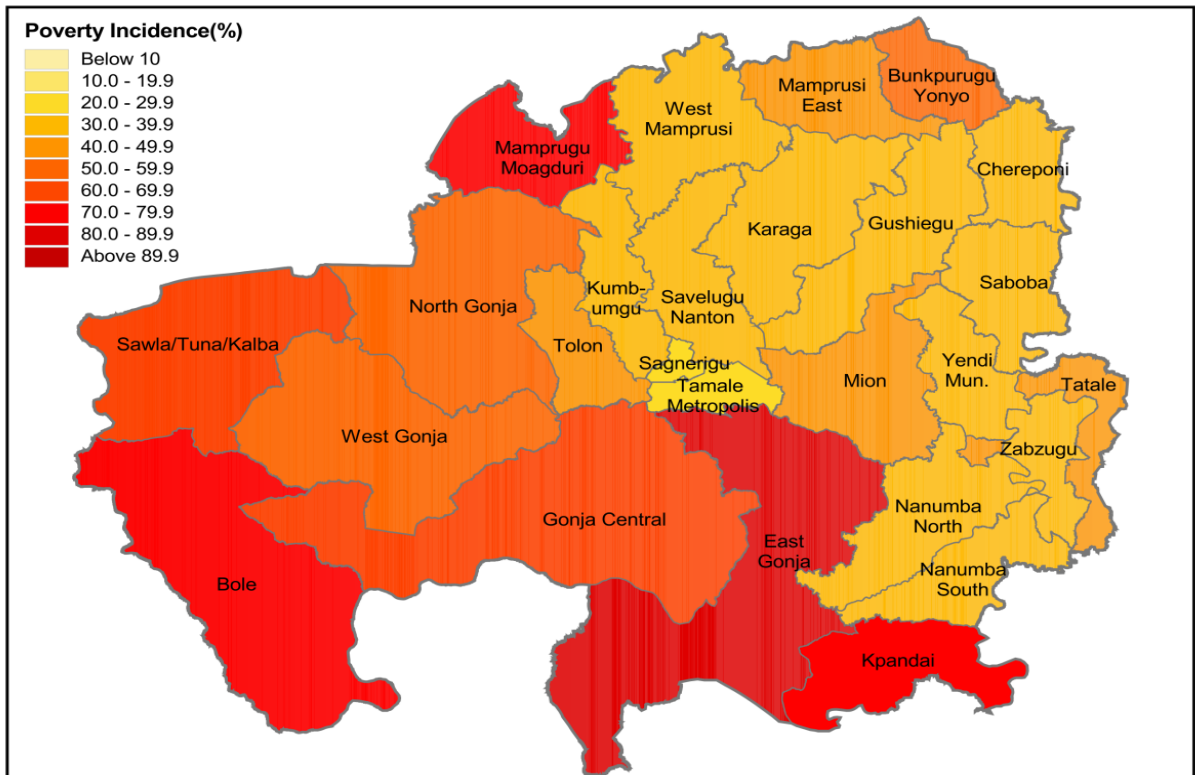

Figure 3.34: Estimated Number of Poor Persons - Northern Region

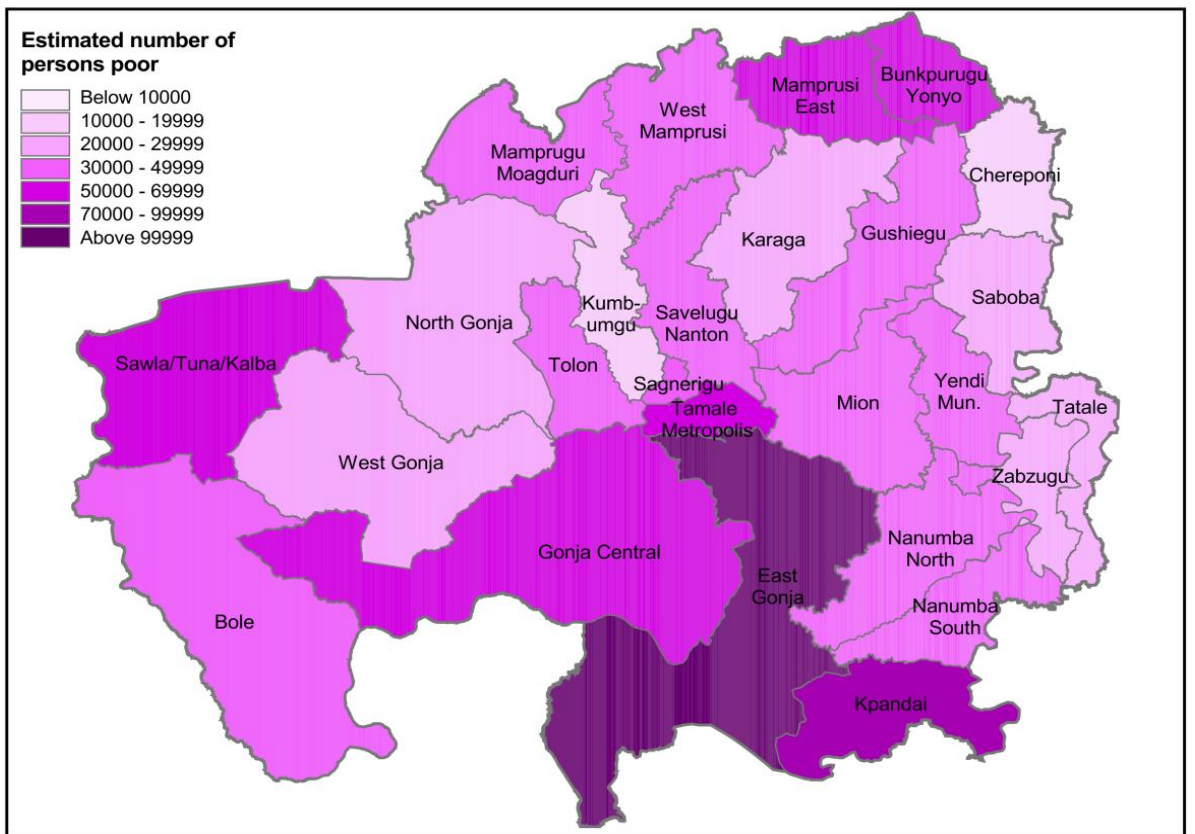

Figure 3.35: Poverty Depth – Northern Region

Figure 3.36: Poverty Inequality - Northern Region

UPPER EAST REGION

There exist variations in poverty incidence among districts in the Upper East Region. Table A1.9 Figures 3.37 to 3.40 indicate that the incidence of poverty is highest in Builsa South (84.4%), followed by Bawku West (68.1%), Bongo (67.4%) and Nabdam (63.0%) districts. The lowest poverty incidence is observed in Kassena Nankana West District (13.1%). In terms of depth of poverty, a similar pattern is observed (Builsa South - 51.8%, Bawku West - 37.2%, Bongo - 36.4%, and Nabdam - 31.3%).

Although Builsa South District has the highest level of poverty incidence, it recorded the lowest inequality (48.5). Inequality is highest in Bawku West (57.9) followed by Garu Tempene (54.8) and Bongo (54.4) districts.

Garu Tempene, with a poverty incidence of 54.5 percent, has the highest number of poor persons (70,087) in the region followed by Bawku West (63,315) and Bongo (56,622). Though Builsa South has the highest poverty incidence of 84.4 percent, the population poor is 30,730.

Figure 3.37: Poverty Incidence – Upper East Region

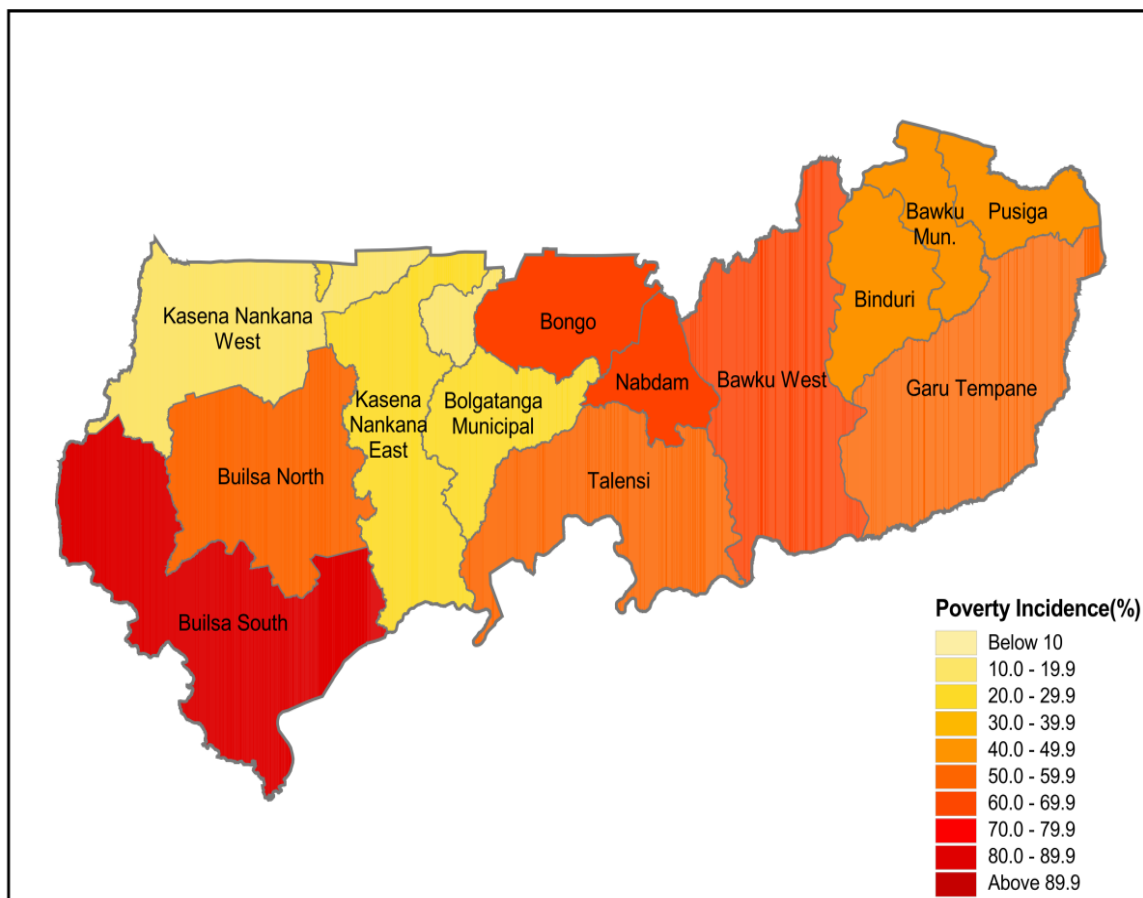

Figure 3.38: Estimated Number of Poor Persons - Upper East Region

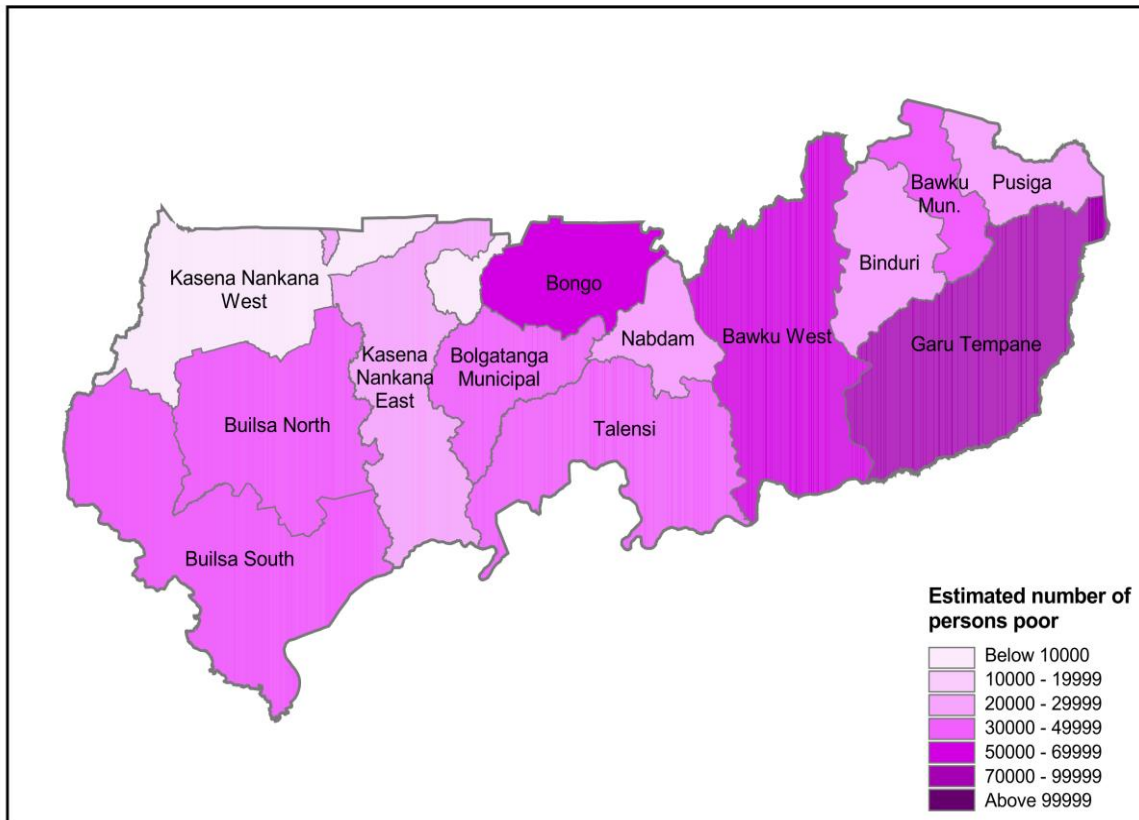

Figure 3.39: Poverty Depth – Upper East Region

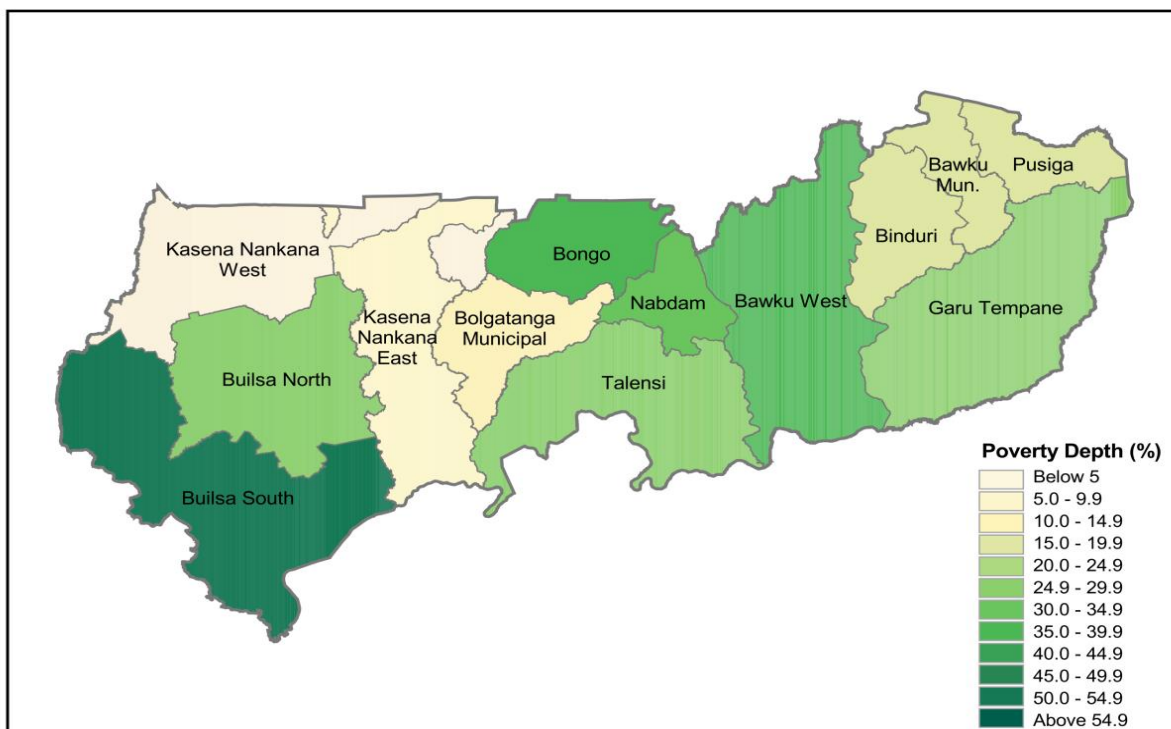

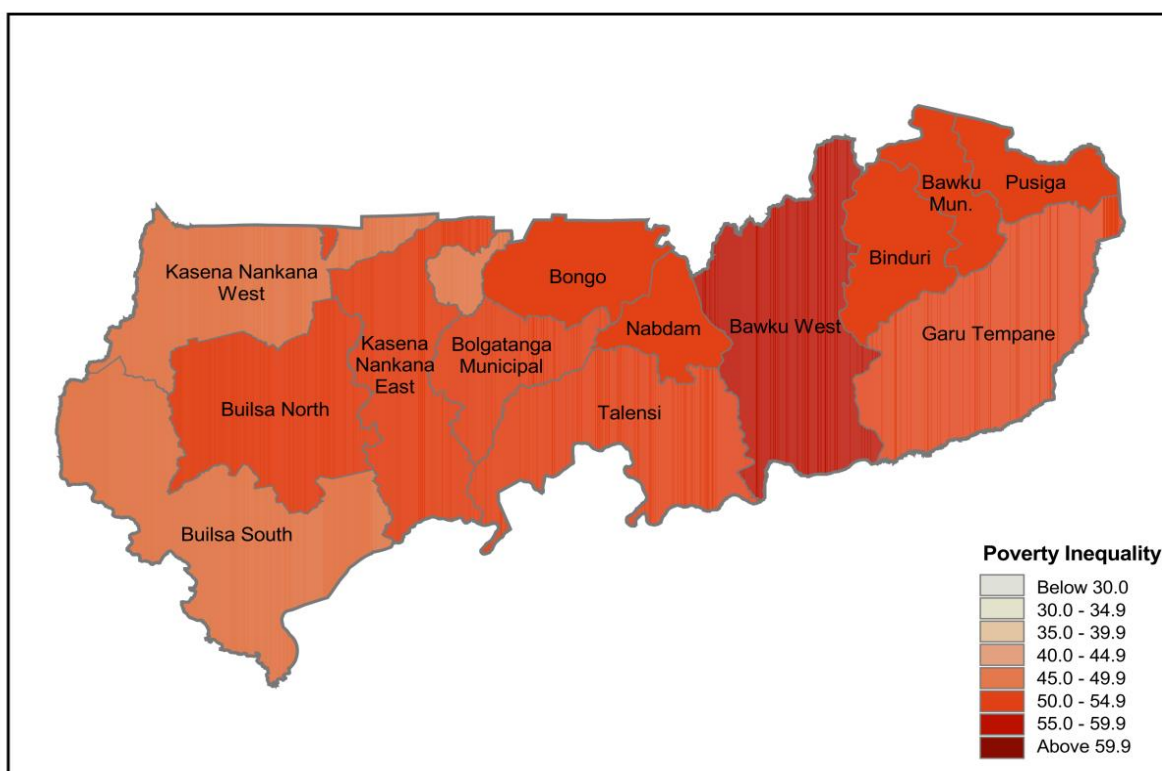

Figure 3.40: Poverty Inequality - Upper East Region

UPPER WEST REGION

Upper West Region (70.7%) has the highest poverty incidence among all the regions in Ghana. Wa West (92.4%) recorded the highest poverty headcount, followed by Wa East (83.8%) and Sissala West (81.2%) districts. The poverty headcount for Wa Municipal (35.5%) is the lowest in the region. The incidence rates for eight out of the 11 districts in the region range from 71.4 to 92.4 percent, and are above the regional average of 69.4 percent (Table A10 and Figures 3.41 to 3.44).

The depth of poverty follows a similar pattern and is highest in Wa West (59.0%), followed by Wa East (46.1%) and Sissala West (44.8%) districts. Wa Municipal has the lowest depth of poverty (13.8%) among the districts in the region.

With respect to inequality, there is not much variation among the districts in the region as shown in Table A1.10. Inequality ranges from 41.5 in Wa East to 47.5 in Lambussie Karni. Sissala East and Sissala West have the same level of inequality (43.3).

In terms of the number of poor persons, Wa West (74,297) has the highest, followed by Jirapa (62,364) and Wa East (59,577) districts. Daffiama Bussie, which has the lowest population in the region, has the lowest number of poor persons. Wa Municipal, on the other hand, has the largest population of 102,264 in the region but had a relatively low number of poor persons (36,253).

CHAPTER FOUR

CONCLUSIONS

The report provides poverty estimates for all the 216 districts and 29 sub-districts in Ghana. The data from the report are derived from the sixth round of the Ghana Living Standards Survey (GLSS6) and the 2010 Population and Housing Census (2010 PHC). It is the second poverty mapping report produced by GSS, having published the first in 2005. The need for data for planning developmental programmes, monitoring and evaluation at the district level has necessitated the preparation of this report.

The poverty measures presented in this report are the poverty headcount (P_0) and poverty gap (P_1), as well as their standard errors to indicate their level of precision. The Gini coefficient is used to measure inequality. The computed poverty estimates at the regional level using the 2010 PHC data are comparable with their corresponding estimates obtained from GLSS6. This provides confidence in the reliability of the models.

The report reveals significant variations in incidence and depth of poverty among the districts, within and across regions. However, the same cannot be said with respect to inequality. Wa West in the Upper West region has the highest poverty incidence and depth. The least incidence rate is recorded in La Dade Kotopon Municipal in the Greater Accra region. With regard to welfare distribution, Sunyani Municipal in the Brong Ahafo region has the highest inequality. The least inequality is recorded in Upper Manya in the Eastern region. East Gonja in the Northern region has more poor persons than any other district in Ghana. The least number of poor persons is in Suaman District in the Western region.

Poverty maps have become more useful in the context of social safety-net programs. They are best suited to guide spatial targeting, for instance, identifying areas associated with high poverty rates. They are useful to rank geographical areas for phased roll-out programs. However, they are not a substitute for the identification of beneficiaries, which requires household or individual-level targeting. The poverty estimates presented in this report are based on consumption expenditure only, and may not adequately capture other attributes of poverty or vulnerability. These estimates do not explain the causes of poverty. Therefore, specialized surveys may be required to determine them.
